

300 mA CMOS LDO with Shutdown, Bypass and Independent Delayed Reset Function

Features

- LDO with Integrated Microcontroller Reset Monitor Functionality
- Low Input Supply Current (80 μ A, typical)
- Very Low Dropout Voltage
- 10 μ sec (typ.) Wake-Up Time from $\overline{\text{SHDN}}$
- 300 mA Output Current
- Standard or Custom Output and Detected Voltages
- Power-Saving Shutdown Mode
- Bypass Input for Quiet Operation
- Separate Input for Detected Voltage
- 140 msec Minimum $\overline{\text{RESET}}$ Output Duration
- Space-Saving MSOP Package
- Specified Junction Temperature Range:
-40°C to +125°C

Applications

- Battery-Operated Systems
- Portable Computers
- Medical Instruments
- Pagers
- Cellular / GSM / PHS Phones

Package Type

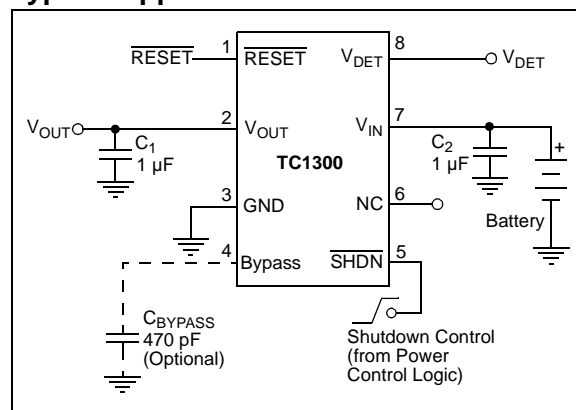

General Description

The TC1300 combines a low dropout regulator and a microcontroller reset monitor in an 8-Pin MSOP package. Total supply current is 80 μ A (typical), 20 to 60 times lower than bipolar regulators.

The TC1300 has a precise output with a typical accuracy of $\pm 0.5\%$. Other key features include low noise operation, low dropout voltage and internal feed-forward compensation for fast response to step changes in load. The TC1300 has both over-temperature and over-current protection. When the shutdown control ($\overline{\text{SHDN}}$) is low, the regulator output voltage falls to zero, $\overline{\text{RESET}}$ output remains valid and supply current is reduced to 30 μ A (typical). The TC1300 is rated for 300 mA of output current and stable with a 1 μ F output capacitor.

An active-low $\overline{\text{RESET}}$ is asserted when the detected voltage (V_{DET}) falls below the reset voltage threshold. The $\overline{\text{RESET}}$ output remains low for 300 msec (typical) after V_{DET} rises above reset threshold. The TC1300 also has a fast wake-up response time (10 μ sec., typical) when released from shutdown.

Typical Application Circuit

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Input Voltage6.5V
 Output Voltage (V_{SS} - 0.3) to (V_{IN} + 0.3)
 Power Dissipation Internally Limited (**Note 6**)
 Operating Junction Temperature, T_J - 40°C < T_J < 150°C
 Maximum Junction Temperature, T_J 150°C
 Storage Temperature..... - 65°C to +150°C
 Maximum Voltage on Any Pin (V_{SS}-0.3) to (V_{IN}+0.3)

***Notice:** Stresses above those listed under “maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

PIN DESCRIPTIONS

Pin	Description
$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ output remains low while V _{DET} is below the reset voltage threshold and for 300 msec after V _{DET} rises above reset threshold.
V _{OUT}	Regulated Voltage Output
GND	Ground Terminal
Bypass	Reference Bypass Input. Connecting an optional 470 pF to this input further reduces output noise.
$\overline{\text{SHDN}}$	Shutdown Control Input. The regulator is fully enabled when a logic high is applied to this input. The regulator enters shutdown when a logic low is applied to this input. During shutdown, regulator output voltage falls to zero, $\overline{\text{RESET}}$ output remains valid and supply current is reduced to 30 μA (typ.).
NC	No connect
V _{IN}	Power Supply Input
V _{DET}	Detected Input Voltage. V _{DET} and V _{IN} can be connected together.

ELECTRICAL CHARACTERISTICS

V_{IN} = V_{OUT} + 1V, I_L = 0.1 mA, C_L = 3.3 μF , $\overline{\text{SHDN}} > V_{IH}$, T_A = 25°C, unless otherwise noted. **BOLDFACE** type specifications apply for junction temperature (**Note 8**) of -40°C to +125°C.

Parameters	Sym	Min	Typ	Max	Units	Conditions
Input Operating Voltage	V _{IN}	2.7	—	6.0	V	Note 7
Maximum Output Current	I _{OUTMAX}	300	—	—	mA	
Output Voltage	V _{OUT}	— V_R - 2.5%	V _R ± 0.5% —	— V_R + 2.5%	V	Note 1
V _{OUT} Temperature Coefficient	$\Delta V_{OUT}/\Delta T$	—	25	—	ppm/°C	Note 2
Line Regulation	$\Delta V_{OUT}/\Delta V_{IN}$	—	0.02	0.35	%	(V _R + 1V) ≤ V _{IN} ≤ 6V
Load Regulation	$\Delta V_{OUT}/V_{OUT}$	—	0.5	2.0	%	I _L = 0.1 mA to I _{OUTMAX} , Note 3

Note 1: V_R is the regulator output voltage setting.

$$2: TC_{V_{OUT}} = \frac{(V_{OUTMAX} - V_{OUTMIN}) \times 10^6}{V_{OUT} \times \Delta T}$$

- Regulation is measured at a constant junction temperature using low duty cycle pulse testing. Load regulation is tested over a load range from 0.1 mA to the maximum specified output current. Changes in output voltage due to heating effects are covered by the thermal regulation specification.
- Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at a 1V differential.
- Thermal Regulation is defined as the change in output voltage at a time t after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a current pulse equal to I_{LMAX} at V_{IN} = 6V for t = 10 msec.
- The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction-to-air (i.e. T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation causes the device to initiate thermal shutdown. Please see Section 4.0, “Thermal Considerations”, of this data sheet for more details.
- The minimum V_{IN} has to meet two conditions: V_{IN} ≥ 2.7V and V_{IN} ≥ (V_R + V_{DROPOUT}).
- The junction temperature of the device is approximated by soaking the device under test at an ambient temperature equal to the desired junction temperature. The test time is small enough such that the rise in the junction temperature over the ambient temperature is not significant.

3.0 DETAILED DESCRIPTION

The TC1300 is a combination of a fixed output, low dropout regulator and a microcontroller monitor/RESET. Unlike bipolar regulators, the TC1300 supply current does not increase with load current. In addition, V_{OUT} remains stable and within regulation over the entire specified operating load range (0 mA to 300 mA) and operating input voltage range (2.7V to 6.0V).

Figure 3-1 shows a typical application circuit. The regulator is enabled any time the shutdown input (SHDN) is above V_{IH} . The regulator is shutdown (disabled) when SHDN is at or below V_{IL} . SHDN may be controlled by a CMOS logic gate or an I/O port of a microcontroller. If the SHDN input is not required, it should be connected directly to the input supply. While in shutdown, supply current decreases to 30 μ A (typical), V_{OUT} falls to zero and RESET remains valid.

3.1 RESET Output

The RESET output is driven active-low within 160 μ sec of V_{DET} falling through the reset voltage threshold. RESET is maintained active for a minimum of 140 msec after V_{DET} rises above the reset threshold. The TC1300 has an active-low RESET output. The output of the TC1300 is valid down to $V_{DET} = 1V$ and is optimized to reject fast transient glitches on the V_{DET} line.

FIGURE 3-1: Typical Application Circuit.

3.2 Output Capacitor

A 1 μ F (min) capacitor from V_{OUT} to ground is required. A 1 μ F capacitor should also be connected from V_{IN} to GND if there is more than 10 inches of wire between the regulator and the AC filter capacitor, or if a battery is used as the power source. As with all low dropout regulators, a minimum output capacitance is required to stabilize the output voltage. For the TC1300, a minimum of 1 μ F of output capacitance is enough to stabilize the device over the entire operating load and line range. The selected output capacitor plays an important role in compensating the LDO regulator. For the

TC1300, the selected output capacitor equivalent series resistance (ESR) range is 0.1 ohms to 5 ohms when using 1 μ F of output capacitance, and 0.01 ohms to 5 ohms when using 10 μ F of output capacitance. Because of the ESR requirement, tantalum and aluminum electrolytic capacitors are recommended. Aluminum electrolytic capacitors are not recommended for operation at temperatures below -25°C. When operating from sources other than batteries, rejection and transient responses can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

3.3 Bypass Input (Optional)

An optional 470 pF capacitor connected from the Bypass input to ground reduces noise present on the internal reference, which in turn significantly reduces output noise and improves PSRR performance. This input may be left unconnected. Larger capacitor values may be used, but results in a longer time period to rated output voltage when power is initially applied.

3.4 Turn On Response

The turn-on response is defined as two separate response categories, Wake-Up Time (t_{WK}) and Settling Time (t_s).

The TC1300 has a fast Wake-Up Time (10 μ sec typical) when released from shutdown. See Figure 3-2 for the Wake-Up Time designated as t_{WK} . The Wake-Up Time is defined as the time it takes for the output to rise to 2% of the V_{OUT} value after being released from shutdown.

The total turn-on response is defined as the Settling Time (t_s) (see Figure 3-2). Settling Time (inclusive with t_{WK}) is defined as the condition when the output is within 2% of its fully enabled value (50 μ sec typical) when released from shutdown. The settling time of the output voltage is dependent on load conditions and output capacitance on V_{OUT} (RC response).

FIGURE 3-2: Wake-Up Response Time.

4.0 THERMAL CONSIDERATIONS

4.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when the die temperature exceeds 150°C. The regulator remains off until the die temperature drops to approximately 140°C.

4.2 Power Dissipation

The amount of power the regulator dissipates is primarily a function of input and output voltage, and output current. The following equation is used to calculate worst case *actual* power dissipation:

EQUATION

$$P_D \approx (V_{INMAX} - V_{OUTMIN})I_{LOADMAX}$$

Where:

P_D = worst case actual power dissipation
 V_{INMAX} = maximum voltage on V_{IN}
 V_{OUTMIN} = minimum regulator output voltage
 $I_{LOADMAX}$ = maximum output (load) current

The maximum allowable power dissipation, P_{DMAX} , is a function of the maximum ambient temperature (T_{AMAX}), the maximum recommended die temperature (125°C) and the thermal resistance from junction-to-air (θ_{JA}). The MSOP-8 package has a θ_{JA} of approximately 200°C/Watt when mounted on a FR4 dielectric copper clad PC board.

EQUATION

$$P_{DMAX} = \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}}$$

The worst case actual power dissipation equation can be used in conjunction with the LDO maximum allowable power dissipation equation to ensure regulator thermal operation is within limits. For example:

Given:

$$\begin{aligned} V_{INMAX} &= 4.1V \\ V_{OUTMIN} &= 3.0V - 2.5\% \\ I_{LOADMAX} &= 200 \text{ mA} \\ T_{JMAX} &= 125^\circ\text{C} \\ T_{AMAX} &= 55^\circ\text{C} \\ \theta_{JA} &= 200^\circ\text{C/W} \end{aligned}$$

Find:

EQUATION: ACTUAL POWER DISSIPATION

$$\begin{aligned} P_D &\approx (V_{INMAX} - V_{OUTMIN})I_{LOADMAX} \\ &= [(4.1) - (3.0 \times .975)]200 \times 10^{-3} \\ &= 220 \text{ mW} \end{aligned}$$

EQUATION: MAXIMUM ALLOWABLE POWER DISSIPATION

$$\begin{aligned} P_{DMAX} &= \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}} \\ &= \frac{(125 - 55)}{200} \\ &= 350 \text{ mW} \end{aligned}$$

In this example, the TC1300 dissipates a maximum of only 220 mW; below the allowable limit of 350 mW. In a similar manner, the maximum actual power dissipation equation and the maximum allowable power dissipation equation can be used to calculate maximum current and/or input voltage limits. For example, the maximum allowable V_{IN} is found by substituting the maximum allowable power dissipation of 350 mW into the actual power dissipation equation, from which $V_{INMAX} = 4.97V$.

4.3 Layout Considerations

The primary path of heat conduction out of the package is via the package leads. Therefore, layouts having a ground plane, wide traces at the pads and wide power supply bus lines combine to lower θ_{JA} and, therefore, increase the maximum allowable power dissipation limit.

- e) TC1300R-3.3VUA: 300mA CMOS LDO w/Shutdown, Bypass & Independent Delayed Reset, 3.3V output voltage, 2.63V RESET Threshold.
- f) TC1300R-2.85VUATR: 300mA CMOS LDO w/ Shutdown, Bypass & Independent Delayed Reset, 2.85V output voltage, 2.63V RESET Threshold, tape and reel.
- g) TC1300Y-2.7VUA: 300mA CMOS LDO w/ Shutdown, Bypass & independent Delayed Reset, 2.7V output voltage, 2.4V RESET Threshold.

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

TC1300

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC³² logo, rPIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MTP, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

Analog-for-the-Digital Age, Application Maestro, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniclient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICkit, PICtail, REAL ICE, rLAB, Select Mode, SQI, Serial Quad I/O, Total Endurance, TSHARC, UniWinDriver, WiperLock, ZENA and Z-Scale are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

GestIC and ULPP are registered trademarks of Microchip Technology Germany II GmbH & Co. & KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
