1. STYLES AND FORMATTING CONVENTIONS

1.1. Overview

This chapter describes formatting and styles used through the document.

1.2. Number Representation

Numbers in a base other than decimal have a prefix or postfix as indicator. All numbers use little endian formatting, most significant bit/digit is to the left. Digits for binary and hexadecimal representation are grouped with a single space every four digits to improve readability. Binary numbers use “b” as postfix, hexadecimal numbers use “0x” as prefix.

For example 1011b binary = 0xB hexadecimal = 11 decimal.

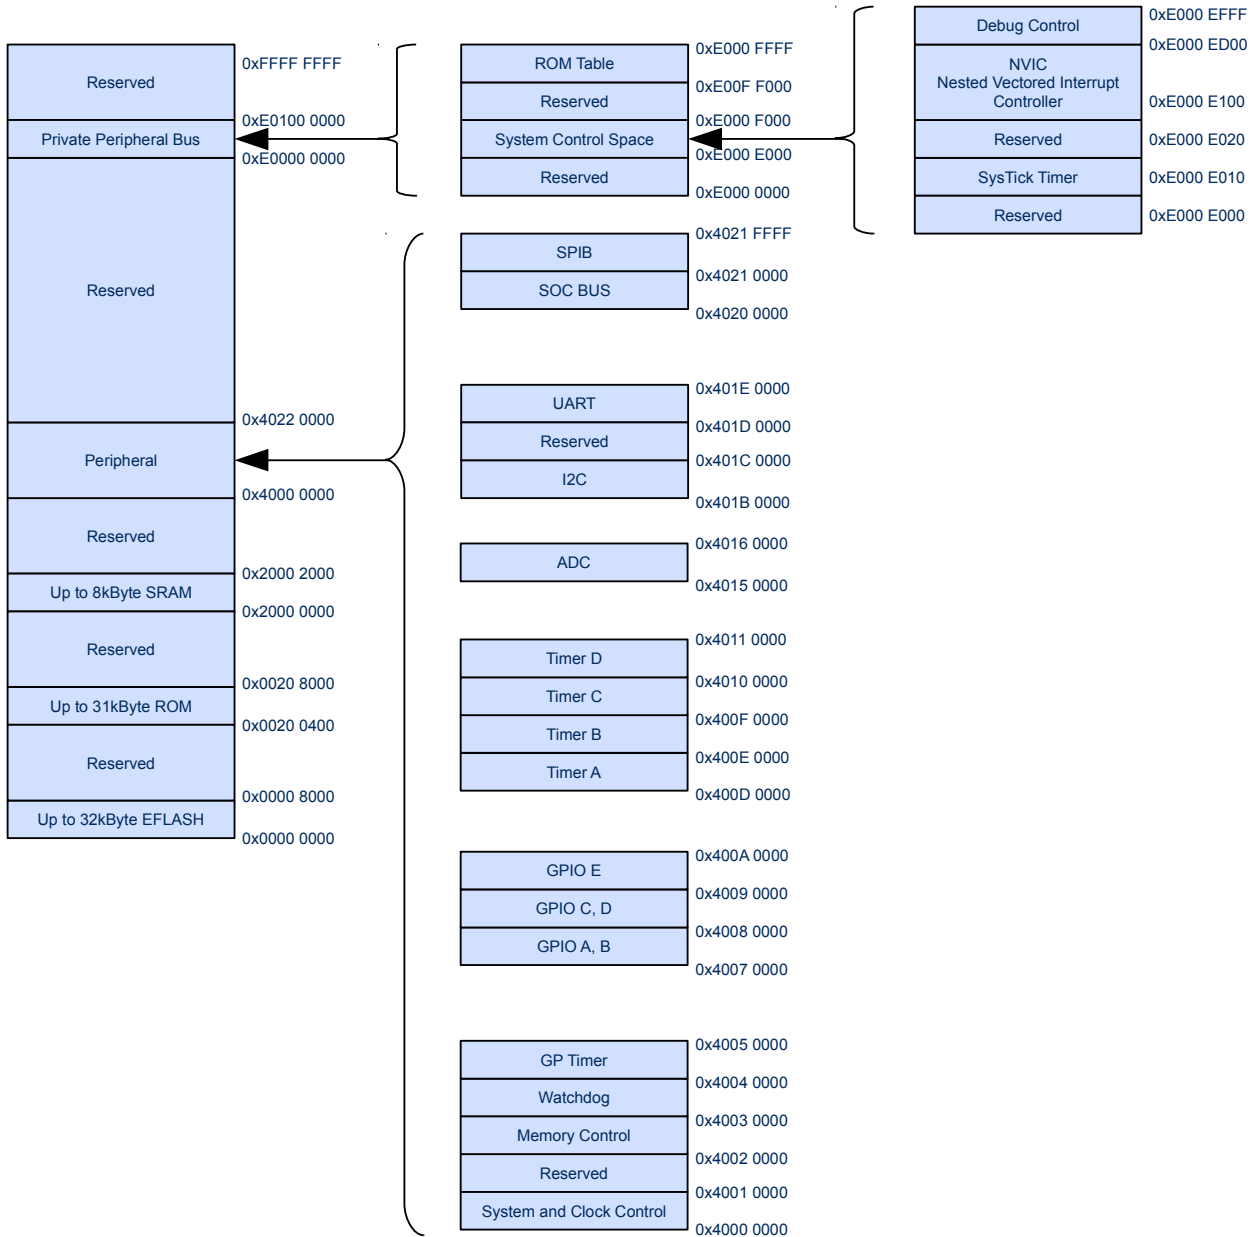

1.3. Formatting Styles

TYPE	EXAMPLE	DESCRIPTION
Register Name	RTCCTL	Register names use capital letter and bold formatting.
Register Bit(s)	RTCCTL.RTCCLKDIV	Register bits are always represented with the register name separated with a period
Function selected by Register bit(s)	[RTCCTL.RTCCLKDIV]	Within text blocks, functions selected with a register bit setting are set in brackets. For example [RTCCTL.RTCCLKDIV] means divider settings /2 to /65536.
Pin Function	XIN	Pin functions use capital letters
Formulas	CLK = FCLK / DIV	Formulas use Teletype font.
Links	Number Representation	Clickable Links are underlined and blue
CPU Mnemonic	MRS	CPU Mnemonic use Teletype font.
Operands	{ <i>Rd</i> , } <i>Rn</i> , <i>Rm</i>	Operands use Italic
Code examples	B loopA	Code examples use Teletype font.

2. MEMORY AND REGISTER MAP

2.1. Memory Map

Figure 2-1. Memory Map

2.2. Register Map

Table 2-1. Embedded FLASH Register Map

ADDRESS	NAME	DESCRIPTION
Embedded FLASH		
0x0000 0000 – 0x0000 03FF	EFLASHP0	EFLASH page 0
0x0000 0400 – 0x0000 07FF	EFLASHP1	EFLASH page 1
0x0000 0800 – 0x0000 0BFF	EFLASHP2	EFLASH page 2
0x0000 0C00 – 0x0000 0FFF	EFLASHP3	EFLASH page 3
0x0000 1000 – 0x0000 13FF	EFLASHP4	EFLASH page 4
0x0000 1400 – 0x0000 17FF	EFLASHP5	EFLASH page 5
0x0000 1800 – 0x0000 1BFF	EFLASHP6	EFLASH page 6
0x0000 1C00 – 0x0000 1FFF	EFLASHP7	EFLASH page 7
0x0000 2000 – 0x0000 23FF	EFLASHP8	EFLASH page 8
0x0000 2400 – 0x0000 27FF	EFLASHP9	EFLASH page 9
0x0000 2800 – 0x0000 2BFF	EFLASHP10	EFLASH page 10
0x0000 2C00 – 0x0000 2FFF	EFLASHP11	EFLASH page 11
0x0000 3000 – 0x0000 33FF	EFLASHP12	EFLASH page 12
0x0000 3400 – 0x0000 37FF	EFLASHP13	EFLASH page 13
0x0000 3800 – 0x0000 3BFF	EFLASHP14	EFLASH page 14
0x0000 3C00 – 0x0000 3FFF	EFLASHP15	EFLASH page 15
0x0000 4000 – 0x0000 43FF	EFLASHP16	EFLASH page 16
0x0000 4400 – 0x0000 47FF	EFLASHP17	EFLASH page 17
0x0000 4800 – 0x0000 4BFF	EFLASHP18	EFLASH page 18
0x0000 4C00 – 0x0000 4FFF	EFLASHP19	EFLASH page 19
0x0000 5000 – 0x0000 53FF	EFLASHP20	EFLASH page 20
0x0000 5400 – 0x0000 57FF	EFLASHP21	EFLASH page 21
0x0000 5800 – 0x0000 5BFF	EFLASHP22	EFLASH page 22
0x0000 5C00 – 0x0000 5FFF	EFLASHP23	EFLASH page 23
0x0000 6000 – 0x0000 63FF	EFLASHP24	EFLASH page 24
0x0000 6400 – 0x0000 67FF	EFLASHP25	EFLASH page 25
0x0000 6800 – 0x0000 6BFF	EFLASHP26	EFLASH page 26
0x0000 6C00 – 0x0000 6FFF	EFLASHP27	EFLASH page 27
0x0000 7000 – 0x0000 73FF	EFLASHP28	EFLASH page 28
0x0000 7400 – 0x0000 77FF	EFLASHP29	EFLASH page 29
0x0000 7800 – 0x0000 7BFF	EFLASHP30	EFLASH page 30
0x0000 7C00 – 0x0000 7FFF	EFLASHP31	EFLASH page 31

Table 2-2. ROM Register Map

ADDRESS	NAME	DESCRIPTION
INFO ROM		
0x0010 0000 – 0x0010 000F	Reserved	Reserved
0x0010 0010	ROSC11	ROSC frequency in Hz at 11b setting (8 MHz)
0x0010 0014	Reserved	Reserved
0x0010 0018	Reserved	Reserved
0x0010 001C	Reserved	Reserved
0x0010 0020	VREF	2.5V Voltage reference in mV
0x0010 0022	ADCGAIN	ADC gain in mV
0x0010 0024	ADCOFF	AD offset in mV
0x0010 0026	Reserved	Reserved
0x0010 0028	FTTEMP ¹	Test temperature for internal temp sensor in °C
0x0010 002A	TTEMPS ²	Internal temp sensor reading at FTTEMP temperature in AD count
0x0010 002C	CLKREF	4MHz CLKREF frequency in Hz
0x0010 0030 – 0x0010 003F	Reserved	Reserved
0x0010 0040	DIEREV	Die revision
0x0010 0044	PACIDR	PAC part number and rev
0x0010 0048 – 0x0010 00FF	Reserved	Reserved
DATA ROM		
0x0020 0400 – 0x0020 7FFF	ROM	ROM Area

Table 2-3. System Clock Control Register Map

ADDRESS	NAME	DESCRIPTION
System Clock Control		
0x4000 0000	SCCTL	System clock control
0x4000 0004	PLLCTL	PLL control
0x4000 0008	ROSCCTL	Ring oscillator control
0x4000 000C	XTALCTL	Crystal driver control

Table 2-4. FLASH Memory Controller Register Map

- Note that the FTTEMP value may not be configured in the PAC52XX device. If the value is 0xFFFF, then the user should assume the nominal value of 25 (degrees C).
- Note that the TTEMPS value may not be configured in the PAC52XX device. If the value is 0xFFFF, then the user should assume the nominal value of 614 (ADC counts).

ADDRESS	NAME	DESCRIPTION
FLASH Memory Controller		
0x4002 0000	FLASHLOCK	FLASH lock
0x4002 0004	FLASHCTL	FLASH Control
0x4002 0008	FLASHPAGE	FLASH page selection
0x4002 000C	Reserved	Reserved
0x4002 0010	Reserved	Reserved
0x4002 0014	FLASHPERASE	FLASH page erase
0x4002 0018	Reserved	Reserved
0x4002 001C	Reserved	Reserved
0x4002 0020	Reserved	Reserved
0x4002 0024	SWDACCESS	SWD access control
0x4002 0028	FLASHWSTATE	FLASH wait state control
0x4002 002C	FLASHBWRITE	FLASH buffered write enable
0x4002 0030	FLASHBWDATA	FLASH buffered write data and address

Table 2-5. Watchdog Timer Register Map

ADDRESS	NAME	DESCRIPTION
Watchdog Timer		
0x4003 0000	WDTCTL	Watchdog timer control
0x4003 0004	WDTCDV	Watchdog timer count-down value
0x4003 0008	WDTCTR	Watchdog timer counter

Table 2-6. General Purpose Timer Register Map

ADDRESS	NAME	DESCRIPTION
Real Time Clock		
0x4004 0000	RTCCTL	General purpose timer control
0x4004 0004	RTCCDV	General purpose timer count-down value
0x4004 0008	RTCCTR	General purpose timer counter

Table 2-7. GPIO Port A Register Map

ADDRESS	NAME	DESCRIPTION
GPIO Port A		
0x4007 0000	GPIOAOUT	GPIO Port A output
0x4007 0004	GPIOAOUTEN	GPIO Port A output enable
0x4007 0008	GPIOADS	GPIO Port A output drive strength
0x4007 000C	GPIOAPU	GPIO Port A output weak pull up
0x4007 0010	GPIOAPD	GPIO Port A output weak pull down
0x4007 0014	GPIOAIN	GPIO Port A input
0x4007 0018	Reserved	Reserved
0x4007 001C	GPIOAPSEL	GPIO Port A peripheral select
0x4007 0020	GPIOAINTP	GPIO Port A interrupt polarity select
0x4007 0024	GPIOAINTEN	GPIO Port A interrupt enable select
0x4007 0028	GPIOAINTF	GPIO Port A interrupt flag
0x4007 002C	GPIOAINTM	GPIO Port A interrupt mask

Table 2-8. GPIO Port B Register Map

ADDRESS	NAME	DESCRIPTION
GPIO Port B		
0x4007 0040	GPIOBOUT	GPIO Port B output
0x4007 0044	GPIOBOUTEN	GPIO Port B output enable
0x4007 0048	GPIOBODS	GPIO Port B output drive strength
0x4007 004C	GPIOBPU	GPIO Port B output weak pull up
0x4007 0050	GPIOBPD	GPIO Port B output weak pull down
0x4007 0054	GPIOBIN	GPIO Port B input
0x4007 0058	Reserved	Reserved
0x4007 005C	GPIOBPSEL	GPIO Port B peripheral select
0x4007 0060	GPIOBINTP	GPIO Port B interrupt polarity select
0x4007 0064	GPIOBINTE	GPIO Port B interrupt enable select
0x4007 0068	GPIOBINTF	GPIO Port B interrupt flag
0x4007 006C	GPIOBINTM	GPIO Port B interrupt mask

Table 2-9. GPIO Port AB Register Map

ADDRESS	NAME	DESCRIPTION
GPIO Port AB		
0x4007 0080	GPIOABOUT	GPIO Port AB output
0x4007 0084	GPIOABOUTEN	GPIO Port AB output enable
0x4007 0088	GPIOABODS	GPIO Port AB output drive strength
0x4007 008C	GPIOABPU	GPIO Port AB output weak pull up
0x4007 0090	GPIOABPD	GPIO Port AB output weak pull down
0x4007 0094	GPIOABIN	GPIO Port AB input
0x4007 0098	Reserved	Reserved
0x4007 009C	GPIOABPSEL	GPIO Port AB peripheral select
0x4007 00A0	GPIOABINTP	GPIO Port AB interrupt polarity select
0x4007 00A4	GPIOABINTE	GPIO Port AB interrupt enable select
0x4007 00A8	GPIOABINTF	GPIO Port AB interrupt flag
0x4007 00AC	GPIOABINTM	GPIO Port AB interrupt mask

Table 2-10. GPIO Port C Register Map

ADDRESS	NAME	DESCRIPTION
GPIO Port C		
0x4008 0000	GPIOCOUT	GPIO Port C output
0x4008 0004	GPIOCOUTEN	GPIO Port C output enable
0x4008 0008	Reserved	Reserved
0x4008 000C	Reserved	Reserved
0x4008 0010	Reserved	Reserved

3.1.2. ROSC11

Register 3-1. ROSC11 (ROSC11 Frequency Value, 0x0010 0010)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	ROSC11	R		ROSC frequency in Hz at setting 11b

3.1.3. VREFV

Register 3-2. VREFV (VREF Reference Voltage Value, 0x0010 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
15:0	VREFV	R		VREF voltage in mV

3.1.4. ADCGAIN

Register 3-3. ADCGAIN (ADC Gain Value, 0x0010 0022)

BIT	NAME	ACCESS	RESET	DESCRIPTION
15:0	ADCGAIN	R		ADC gain in mV

3.1.5. ADCOFF

Register 3-4. ADCOFF (ADC Offset, 0x0010 0024)

BIT	NAME	ACCESS	RESET	DESCRIPTION
15:0	ADCOFF	R		ADC offset in mV

3.1.6. FTTEMP

Register 3-5. FTTEMP (FT Temp value, 0x0010 0028)

BIT	NAME	ACCESS	RESET	DESCRIPTION
15:0	FTTEMP	R		Test temperature for internal temp sensor in °C ³

3.1.7. TEMPS

Register 3-6. TEMPS (Temperature Sensor reading, 0x0010 002A)

BIT	NAME	ACCESS	RESET	DESCRIPTION
15:0	FTTEMP	R		Internal temp sensor ADC reading at FTTEMP ⁴

3.1.8. CLKREF

Register 3-7. CLKREF (CLKREF Frequency Value, 0x0010 002C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	CLKREF	R		4MHz CLKREF frequency in Hz

3.1.9. DIEREV

Register 3-8. DIEREV (Device die revision, 0x0010 0040)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	DIEREV	R		Device die rev

3.1.10. PACIDR

Register 3-9. PACIDR (PAC part number and revision, 0x0010 0044)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	PACIDR	R		Device part number and revision

³ Note that this field may be set to 0xFFFF on some devices. If this is the case, use a value of 25.

⁴ Note that this field may be set to 0xFFFF on some devices. If this is the case, use a value of 614.

3.2. Details of Operation

3.2.1. Overview

The Information block has calibration data for the clocks ROSC and CLKREF, Voltage reference VREF, ADC gain and offset and internal temp sensor, that can be used by firmware for more accurate time and ADC readings.

Also stored are device part number and revision for firmware to verify before running application code.

4. SYSTEM CLOCK CONTROL

4.1. Register

4.1.1. Register Map

Table 4-1. System Clock Control Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
System Clock Control

6:2	PLLINDIV	RW	0x0	PLL input divider 1 1111b: / 33 ... 0 0001b: / 3 0 0000b: / 2
1	Reserved	RW	0x0	Reserved, must be set to 0x0
0	PLEN	RW	0x0	PLL oscillator 1b: enable PLL 0b: disable PLL

4.1.4. OSCCTL

Register 4-3. OSCCTL (Ring Oscillator Control, 0x4000 0008)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:3	Reserved	R	0x0	Reserved
2:1	ROSCP	RW	0x3	Ring oscillator frequency setting 11b = 8.3MHz 10b = 10.7MHz 01b = 15.3MHz 00b = 28.7MHz
0	ROSCEN	RW	0x1	Enable Ring oscillator 1b: enable ROSC 0b: disable ROSC

4.1.5. XTALCTL

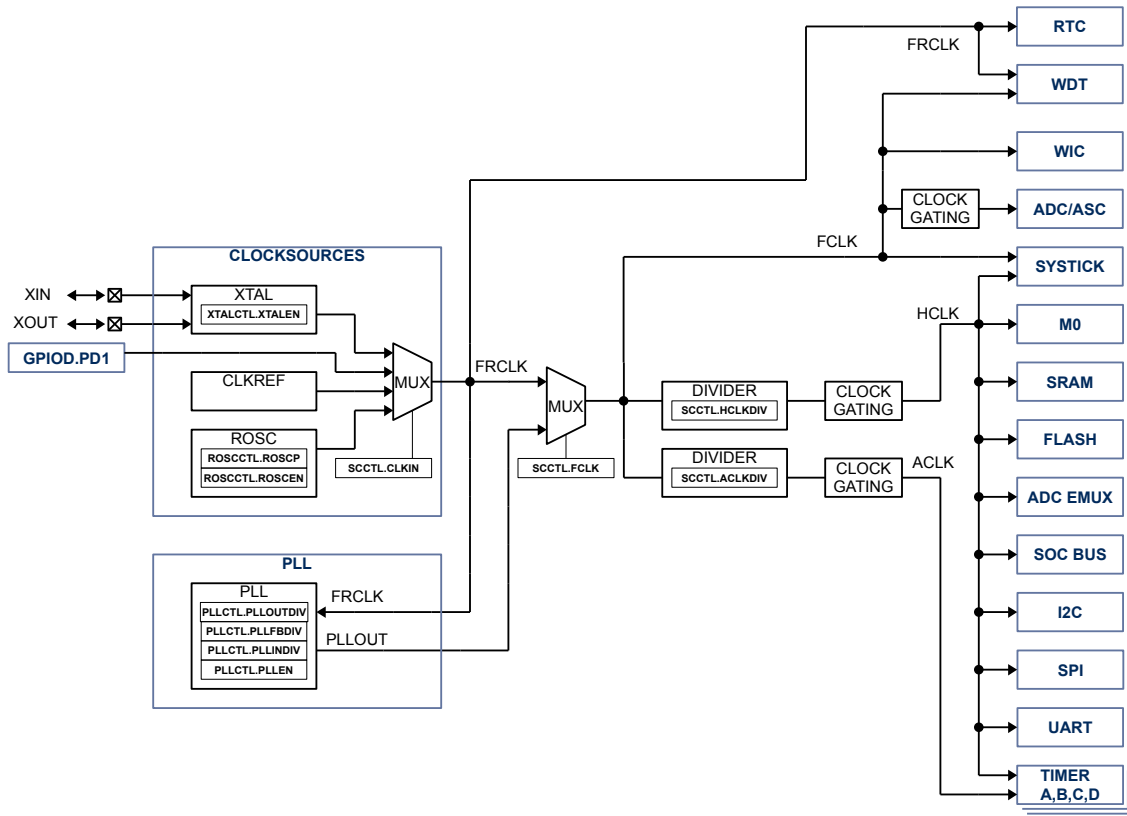

Register 4-4. XTALCTL (Crystal Driver Control, 0x4000 000C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:1	Reserved	R	0x0	Reserved
0	XTALEN	RW	0x0	Enable XTAL driver 1b: enable crystal driver 0b: disable crystal driver

4.2. Details of Operation

4.2.1. Block Diagram

Figure 4-1. System Clock Control

4.2.2. Configuration

Following blocks need to be configured for correct use of the system clock control:

- GPIO.D.PD1
- RTC
- WDT
- WIC
- ADC/ASC
- SYSTICK
- SRAM
- FLASH
- ADC EMUX
- SOC BUS
- I2C

- SPI
- UART
- Timer A, B, C, D

4.2.3. ROSC

The internal ring oscillator has four frequency settings controllable with **OSCCTL.ROSCP** from 8.3MHz to 28.7MHz in four steps. The ROSC can also be disabled using **OSCCTL.ROSCEN**.

4.2.4. CLKREF

The CLKREF provides a 1% trimmed 4MHz clock.

4.2.5. XTAL

The crystal driver supports a range of crystal frequencies from 2MHz to 10MHz. The crystal driver can also be used to input an external clock using XIN.

The crystal driver can be enabled with **XTALCTL.XTALEN**.

4.2.6. EXTCLK

PD1 can be configured as clock input, EXTCLK.

4.2.7. PLL

The clock input to the PLL is FRCLK.

The PLL can be enabled with **PLLCTL.PLEN**.

The PLL output clock PLLOUT is following following equation:

$$PLLOUT = \frac{PLLIN * PLLFBDIV}{PLLINDIV * PLLOUTDIV * 2} \quad (1)$$

Where:

PLLOUT: PLL output frequency in MHz

PLLIN: PLL input frequency in MHz (FRCLK)

PLLINDIV: PLL input divider (2 to 33) **PLLCTL.PLLINDIV**

PLLFBDIV: PLL feedback divider (2 to 513) **PLLCTL.PLLFBDIV**

PLLOUTDIV: PLL output divider (1 to 16) **PLLCTL.PLLOUTDIV**

The input clock frequency and input clock divider selection must follow formula below for correct operation of PLL:

$$1\text{MHz} \leq \frac{PLLIN}{PLLINDIV} \leq 25\text{MHz} \quad (2)$$

The output clock frequency and output clock divider selection must following formula below for correct operation of the PLL

$$100\text{MHz} \leq PLLOUT * PLLOUTDIV \leq 250\text{MHz} \\ PLLOUTDIV \geq 1 \quad (3)$$

The table below shows pre-calculated PLL output frequency settings using the 4MHz ROSC as input.

Table 4-5. PLL output frequency settings using 4MHz ROSC as input

PLL output	PLLOUTDIV	PLLFBDIV	PLLINDIV
10MHz	0x01 (/[1*2])	0x008 (*10)	0x0 (/2)
16.8MHz	0x05 (/[5*2])	0x052 (*84)	0x0 (/2)
20MHz	0x01 (/[1*2])	0x012 (*20)	0x0 (/2)
25MHz	0x01 (/[1*2])	0x019 (*25)	0x0 (/2)
30MHz	0x01 (/[1*2])	0x01C (*30)	0x0 (/2)
33.333MHz	0x01 (/[1*2])	0x030 (*50)	0x1 (/3)
40MHz	0x01 (/[1*2])	0x026 (*40)	0x0 (/2)
50MHz	0x01 (/[1*2])	0x030 (*50)	0x0 (/2)
60MHz	0x01 (/[1*2])	0x03A (*60)	0x0 (/2)
70MHz	0x01 (/[1*2])	0x044 (*70)	0x0 (/2)
80MHz	0x01 (/[1*2])	0x04E (*80)	0x0 (/2)
90MHz	0x01 (/[1*2])	0x058 (*90)	0x0 (/2)
100MHz	0x01 (/[1*2])	0x062 (*100)	0x0 (/2)

4.2.8. FRCLK

The free running clock FRCLK clock source can be selected with **CCSCTL.CLKIN**. From XTAL, EXTCLK, CLKREF, or ROSC.

4.2.9. FCLK

The fast clock FCLK clock source can be selected with **CCSCTL.FCLK** to be either PLLOUT or FRCLK.

4.2.10. HCLK

The high speed clock HCLK clock source input is FCLK. The HCLK can be divided down from FCLK using **CCSCTL.HCLKDIV** from /1 to /8 in 4 steps.

4.2.11. ACLK

The auxiliary clock ACLK clock source input is FCLK. The ACLK can be divided down from FCLK from /1 to /128 in 8 steps.

4.2.12. Clock Gating

When the CPU enters deep sleep mode, the HCLK, ACLK and FCLK to the ADC are clock gated and stopped to save power. Only FRCLK and FCLK continue to run to supply WIC, RTC, and WDT.

5. WATCHDOG TIMER

5.1. Register

5.1.1. Register Map

Table 5-1. Watchdog Timer Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
Watchdog Timer			
0x4003 0000	WDTCTL	Watchdog timer control	0x6300 0000
0x4003 0004	WDTCDV	Watchdog timer count-down value	0x63FF FFFF
0x4003 0008	WDTCTR	Watchdog timer counter	0x00FF FFFF

5.1.2. WDTCTL

Register 5-1. WDTCTL (Watchdog Timer Control, 0x4003 0000)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	KEY	RW	0x63	Key for writing WDTCTL register 0x4A: allow writes to WDTCTL register 0x63: read value of WDTCTL.KEY
23:12	Reserved	R	0x0	Reserved
11	WRBUSY	RW	0x0	WDTCTL write busy 1b = write to WDTCTL still being processed. Any register writes received while this bit is set to a 1b will be dropped and not written to the given register. Any reads will return indeterminate data. 0b = WDT registers not busy
10	WDTCLKSEL	RW	0x0	WDT input clock select 1b: FCLK 0b: FRCLK
9:6	WDTCLKDIV	RW	0x0	WDT clock input divider 1111b: /65536 1110b: /32768 1101b: /16384 1100b: /8192 1011b: /4096 1010b: /2048 1001b: /1024 1000b: /512 0111b: /256 0110b: /128 0101b: /64 0100b: /32 0011b: /16 0010b: /8 0001b: /4 0000b: /2
5	WDTRESETEEN	RW	0x0	Watchdog device RESET enable 1b = WDT trigger device RESET when WDTCTR register counts to 0x0 0b = WDT trigger device RESET disabled
4	WDTINT	RW	0x0	Watchdog interrupt 1b = WDT interrupt 0b = no WDT interrupt

BIT	NAME	ACCESS	RESET	DESCRIPTION
3	WDTINTEN	RW	0x0	Watchdog interrupt enable 1b = enable WDT interrupt 0b = disable WDT interrupt
2:0	WDTCTRRST	RW	0x0	WDTCTR counter reset 101b = write of 101b reset WDTCTR to WDTCDV value

5.1.3. WDTCDV

Register 5-2. WDTCDV (Watchdog Timer Count-Down Value, 0x4003 0004)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	KEY	RW	0x63	Key for writing WDTCDV register 0x4A: allow writes to WDTCDV register 0x63: read value of WDTCDV.KEY
23:0	RSTVALUE	RW	0xFF FFFF	24-bit WDT count-down value

5.1.4. WDTCTR

Register 5-3. WDTCTR (Watchdog Timer Counter, 0x4003 0008)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	Reserved	R	0x0	Reserved
23:0	CTR	RW	0xFF FFFF	Current value of WDT

5.2. Details of Operation

5.2.1. Block Diagram

Figure 5-1. WDT

5.2.2. Configuration

Following blocks need to be configured for correct use of the WDT:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)

5.2.3. Watchdog Timer

The Watchdog timer consist of a 24-bit timer and reset logic. The WDT can be used as general purpose 16bit timer or as watchdog timer that need to be serviced periodically to avoid device reset.

5.2.4. Access WDT Registers

The **WDTCTL** and **WDTCDV** registers can only be written to if **WDTCTL.KEY** or **WDTCDV.KEY** are set to 0x4A.

The read back value of **WDTCTL.KEY** or **WDTCDV.KEY** is always 0x63. The watchdog timer has 2 clock domains, HCLK and WDT clock domain set by **WDTCTL.CLKSEL** and **WDTCTL.WDTCLKDIV**. Writing to any WDT registers may take up to 1 clock cycle on the WDT clock domain to finish. Any ongoing writes to WDT registers are shown with **WDTCTL.WRBUSY**. As long as **WDTCTL.WRBUSY** is 1b, any subsequent writes to WDT registers are ignored and reads only provide undetermined data.

5.2.5. WDT Clock Setting

The WDT can use 2 clocks FCLK or FRCLK, selectable with **WDTCTL.CLKSEL**. For applications where the WDT need to run in CPU sleep mode, FRCLK should be used. The clock input can be further divided down from /2 to /65536 using **WDTCTL.WDTCLKDIV**.

5.2.6. General Purpose Timer Mode

Set **WDTCTL.WDTRESETEN** to 0b to use the WDT as general purpose 24-bit timer. Set the desired count value in WDT clocks in **WDTCDV.RSTVALUE**, set **WDTCTL.WDTCTRRST** to 101b to load **WDTCTR.CTR** with **WDTCDV.RSTVALUE**. To start the GPT timer set **GPTCTL.INTEN**. When **WDTCTR.CTR** reaches 0x0, the timer

automatic reloads **WDTCTR.CTR** with **WDTCDV.RSTVALUE** and continues countdown. The WDT is stopped when **WDTCTL.INTEN** is cleared.

5.2.7. Watchdog Timer Mode

Set **WDTCTL.WDTRESETEEN** to 1b to use the WDT as 24-bit watchdog timer with device reset capability. Set **WDTCTL.WDTINTEN** to 1b to enable interrupt when WDT counts to 0x0. Set the desired count value in WDT clocks in **WDTCDV.RSTVALUE**. To start the WDT count down, set **WDTCTL.WDTCTRRST** to 101b. The WDT will copy the **WDTCTL.RSTVALUE** to **WDTCTR.CTR** and start counting down. When **WDTCTR.CTR** reaches 0x0, the WDT will automatic copy **WDTCTL.RSTVALUE** to **WDTCTR.CTR**, restart the counter and set the interrupt flag if enabled is set. During the second count down, set **WDTCTL.WDTCTRRST** to 101b to restart the 1st WDT countdown and avoid device reset. If the **WDTCTR.CTR** reaches 0x0 during the second count down without being reloaded, the WDT will toggle device reset.

6. GPIO PORT A

6.1. Register

6.1.1. Register Map

Table 6-1. GPIO Port A Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
GPIO Port A			
0x4007 0000	GPIOAOUT	GPIO Port A output	0x0000 0000

5	P5	RW	0x0	Port A 5 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO
4	P4	RW	0x0	Port A 4 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO
3	P3	RW	0x0	Port A 3 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO
2	P2	RW	0x0	Port A 2 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO
1	P1	RW	0x0	Port A 1 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO
0	P0	RW	0x0	Port A 0 weak pull up select 1b: enable weak pull-up to VCCIO 0b: disable weak pull-up to VCCIO

6.1.6. GPIOAPD

Register 6-5. GPIOAPD (GPIO Port A Weak Pull Down, 0x4007 0010)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port A 7 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
6	P6	RW	0x0	Port A 6 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
5	P5	RW	0x0	Port A 5 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
4	P4	RW	0x0	Port A 4 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
3	P3	RW	0x0	Port A 3 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
2	P2	RW	0x0	Port A 2 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
1	P1	RW	0x0	Port A 1 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS
0	P0	RW	0x0	Port A 0 weak pull down select 1b: enable weak pull-down to VSS 0b: disable weak pull-down to VSS

6.1.7. GPIOAIN

Register 6-6. GPIOAIN (GPIO Port A Input, 0x4007 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RW	0x0	Reserved
7	P7	RW	0x0	Port A 7 input state 1b: input high 0b: input low
6	P6	RW	0x0	Port A 6 input state 1b: input high 0b: input low
5	P5	RW	0x0	Port A 5 input state 1b: input high 0b: input low
4	P4	RW	0x0	Port A 4 input state 1b: input high 0b: input low
3	P3	RW	0x0	Port A 3 input state 1b: input high 0b: input low

BIT	NAME	ACCESS	RESET	DESCRIPTION
2	P2	RW	0x0	Port A 2 input state 1b: input high 0b: input low
1	P1	RW	0x0	Port A 1 input state 1b: input high 0b: input low
0	P0	RW	0x0	Port A 0 input state 1b: input high 0b: input low

6.1.8. GPIOAPSEL

Register 6-7. GPIOAPSEL (GPIO Port A Peripheral Select, 0x4007 001C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:16	Reserved	RW	0x0	Reserved
15:14	P7	RW	0x0	Port A 7 peripheral select 11b: PWMC1 / DTGC0HS output or CC1 capture and compare input 10b: PWMA7 / DTGA3HS output or CA7 capture and compare input 01b: PWMA5 / DTGA1HS output or CA5 capture and compare input 00b: I/O mode PA7
13:12	P6	RW	0x0	Port A 6 peripheral select 11b: reserved 10b: PWMB0 / DTGB0LS output or CB0 capture and compare input 01b: PWMA4 / DTGA0HS output or CA4 capture and compare input 00b: I/O mode PA6
11:10	P5	RW	0x0	Port A 5 peripheral select 11b: reserved 10b: PWMD0 / DTGD0LS output or CD0 capture and compare input / IBCTL5 01b: PWMA6 / DTGA2HS output or CA6 capture and compare input / IBCTL5 00b: I/O mode PA5
9:8	P4	RW	0x0	Port A 4 peripheral select 11b: reserved 10b: PWMC0 / DTGC0LS output or CC0 capture and compare input / IBCTL4 01b: PWMA5 / DTGA1HS output or CA5 capture and compare input / IBCTL4 00b: I/O mode PA4
7:6	P3	RW	0x0	Port A 3 peripheral select 11b: PWMB0 / DTGB0LS output or CB0 capture and compare input / IBCTL3 10b: PWMA4 / DTGA0HS output or CA4 capture and compare input / IBCTL3kl 01b: PWMA3 / DTGA3LS output or CA3 capture and compare input / IBCTL3 00b: I/O mode PA3
5:4	P2	RW	0x0	Port A 2 peripheral select 11b: reserved 10b: reserved 01b: PWMA2 / DTGA2LS output or CA2 capture and compare input / IBCTL2 00b: I/O mode PA2

BIT	NAME	ACCESS	RESET	DESCRIPTION
3:2	P1	RW	0x0	Port A 1 peripheral select 11b: reserved 10b: reserved 01b: PWMA1 / DTGA1LS output or CA1 capture and compare input / IBCTL1 00b: I/O mode PA1
1:0	P0	RW	0x0	Port A 0 peripheral select 11b: reserved 10b: reserved 01b: PWMA0 / DTGA0LS output or CA0 capture and compare input / IBCTL0 00b: I/O mode PA0

6.1.9. GPIOAINTP

Register 6-8. GPIOAINTP (GPIO Port A Interrupt Polarity, 0x4007 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port A 7 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
6	P6	RW	0x0	Port A 6 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
5	P5	RW	0x0	Port A 5 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
4	P4	RW	0x0	Port A 4 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
3	P3	RW	0x0	Port A 3 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
2	P2	RW	0x0	Port A 2 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
1	P1	RW	0x0	Port A 1 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
0	P0	RW	0x0	Port A 0 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition

6.1.10. GPIOAINTE

Register 6-9. GPIOAINTE (GPIO Port A Interrupt Enable, 0x4007 0024)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port A 7 interrupt enable 1b: enabled interrupt 0b: disable interrupt

BIT	NAME	ACCESS	RESET	DESCRIPTION
6	P6	RW	0x0	Port A 6 interrupt enable 1b: enabled interrupt 0b: disable interrupt
5	P5	RW	0x0	Port A 5 interrupt enable 1b: enabled interrupt 0b: disable interrupt
4	P4	RW	0x0	Port A 4 interrupt enable 1b: enabled interrupt 0b: disable interrupt
3	P3	RW	0x0	Port A 3 interrupt enable 1b: enabled interrupt 0b: disable interrupt
2	P2	RW	0x0	Port A 2 interrupt enable 1b: enabled interrupt 0b: disable interrupt
1	P1	RW	0x0	Port A 1 interrupt enable 1b: enabled interrupt 0b: disable interrupt
0	P0	RW	0x0	Port A 0 interrupt enable 1b: enabled interrupt 0b: disable interrupt

6.1.11. GPIOINTF

Register 6-10. GPIOINTF (GPIO Port A Interrupt Flag, 0x4007 0028)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port A 7 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
6	P6	RW	0x0	Port A 6 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
5	P5	RW	0x0	Port A 5 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
4	P4	RW	0x0	Port A 4 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
3	P3	RW	0x0	Port A 3 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
2	P2	RW	0x0	Port A 2 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
1	P1	RW	0x0	Port A 1 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
0	P0	RW	0x0	Port A 0 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending

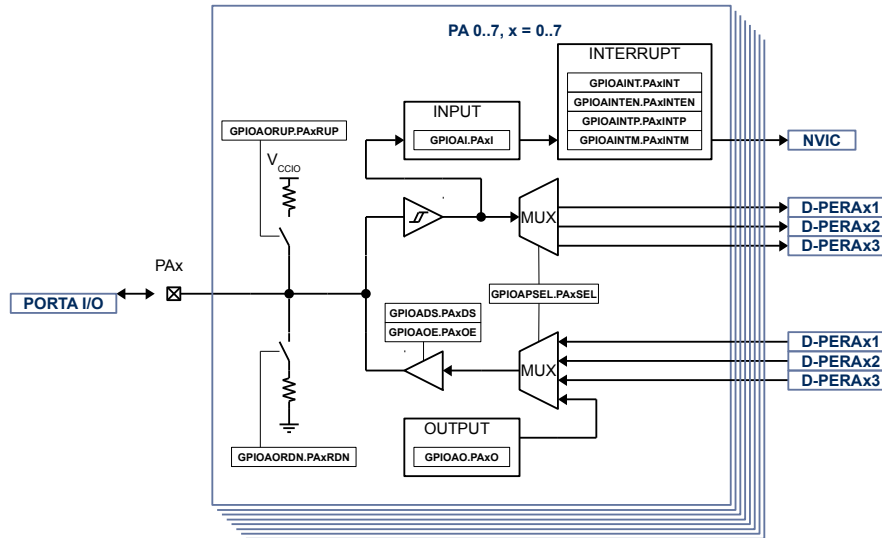

6.1.12. GPIOAINTM
Register 6-11. GPIOAINTM (GPIO Port A Interrupt Mask, 0x4007 002C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port A 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
6	P6	RW	0x0	Port A 6 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
5	P5	RW	0x0	Port A 5 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
4	P4	RW	0x0	Port A 4 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
3	P3	RW	0x0	Port A 3 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
2	P2	RW	0x0	Port A 2 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
1	P1	RW	0x0	Port A 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
0	P0	RW	0x0	Port A 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

6.2. Details of Operation

6.2.1. Block Diagram

Figure 6-1. GPIO Port A

6.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO A:

- Nested Vectored Interrupt Controller (NVIC)
- Gate Driver
- Timer A, PWMA, DTGA
- Timer B, PWMB, DTGB
- Timer C, PWMC, DTGC
- Timer D, PWMD, DTGD
- General Purpose Gate Drivers

6.2.3. GPIO A Block

The GPIO A block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

6.2.4. Input

The input state of GPIOA can be monitored with **GPIOAIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOAPSEL**.

6.2.5. Output and Output Enable

When **GPIOAOUTEN.Px** is enabled, the output state is controlled by **GPIOAOUT.Px**.

When **GPIOAOUTEN.Px** is disabled, the output is in High-Z state.

6.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOADS** to meet application needs. Set **GPIOADS.Px** to enable high current drive strength, reset to enable low current drive strength.

6.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOAPU** and weak pull down can be enabled with **GPIOAPD**.

NOTE:

GPIOAPU.Px or **GPIOAPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

6.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOAPSEL**. When a different function than IO is selected the input state can still be read with **GPIOAIN** and the pull-up and pull-down is still controllable.

6.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOAINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOAINTP**. The state of the interrupt can be read from **GPIOAINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOAINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

7. GPIO PORT B

7.1. Register

7.1.1. Register Map

Table 7-1. GPIO Port B Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
GPIO Port B			
0x4007 0040	GPIOBOUT	GPIO Port B output	0x0000 0000

2	P2	RW	0x0	Reserved, must be written to 0b
1	P1	RW	0x0	Reserved, must be written to 0b
0	P0	RW	0x0	Port B 0 interrupt enable 1b: enabled interrupt 0b: disable interrupt

7.1.11. GPIOBINTF

Register 7-10. GPIOBINTF (GPIO Port B Interrupt Flag, 0x4007 0068)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RW	0x0	Reserved
7	P7	RW	0x0	Port B 7 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
6	P6	RW	0x0	Reserved, must be written to 0b
5	P5	RW	0x0	Reserved, must be written to 0b
4	P4	RW	0x0	Reserved, must be written to 0b
3	P3	RW	0x0	Reserved, must be written to 0b
2	P2	RW	0x0	Reserved, must be written to 0b
1	P1	RW	0x0	Reserved, must be written to 0b
0	P0	RW	0x0	Port B 0 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending

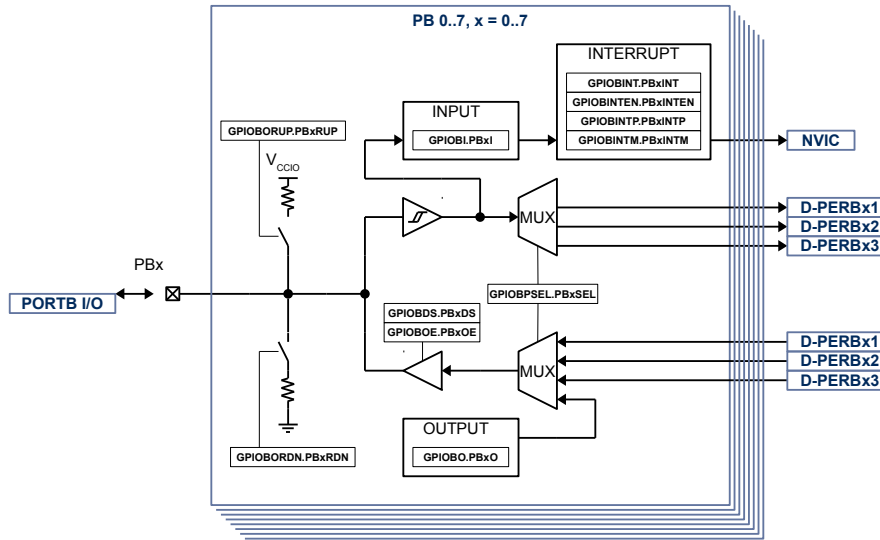

7.1.12. GPIOBINTM
Register 7-11. GPIOBINTM (GPIO Port B Interrupt Mask, 0x4007 006C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port B 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
6	P6	RW	0x0	Reserved, must be written to 0b
5	P5	RW	0x0	Reserved, must be written to 0b
4	P4	RW	0x0	Reserved, must be written to 0b
3	P3	RW	0x0	Reserved, must be written to 0b
2	P2	RW	0x0	Reserved, must be written to 0b
1	P1	RW	0x0	Reserved, must be written to 0b
0	P0	RW	0x0	Port B 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

7.2. Details of Operation

7.2.1. Block Diagram

Figure 7-1. GPIO Port B

7.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO B:

- Nested Vectored Interrupt Controller (NVIC)
- SOC Bus

7.2.3. GPIO B Block

The GPIO B block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

7.2.4. Input

The input state of GPIOB can be monitored with **GPIOBIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOBPSEL**.

7.2.5. Output and Output Enable

When **GPIOBOUTEN.Px** is enabled, the output state is controlled by **GPIOBOUT.Px**.

When **GPIOBOUTEN.Px** is disabled, the output is in High-Z state.

7.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOBDS** to meet application needs. Set **GPIOBDS.Px** to enable high current drive strength, reset to enable low current drive strength.

7.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOBPU** and weak pull down can be enabled with **GPIOBPD**.

NOTE:

GPIOBPU.Px or **GPIOBPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

7.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOBPSEL**. When a different function than IO is selected the input state can still be read with **GPIOBIN** and the pull-up and pull-down is still controllable.

7.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOBINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOBINTP**. The state of the interrupt can be read from **GPIOBINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOBINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

8. GPIO PORT C

8.1. Register

8.1.1. Register Map

Table 8-1. GPIO Port C Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
GPIO Port C

BIT	NAME	ACCESS	RESET	DESCRIPTION
5	P5	RW	0x0	Port C 5 input state 1b: input high 0b: input low
4	P4	RW	0x0	Port C 4 input state 1b: input high 0b: input low
3	P3	RW	0x0	Port C 3 input state 1b: input high 0b: input low
2	P2	RW	0x0	Port C 2 input state 1b: input high 0b: input low
1	P1	RW	0x0	Port C 1 input state 1b: input high 0b: input low
0	P0	RW	0x0	Port C 0 input state 1b: input high 0b: input low

8.1.5. GPIOCINE

Register 8-4. GPIOCINE (GPIO Port C Input Enable, 0x4008 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port C 7 input enable 1b: input enabled, for I/O operation 0b: input disabled
6	P6	RW	0x0	Port C 6 input enable 1b: input enabled, for I/O operation 0b: input disabled
5	P5	RW	0x0	Port C 5 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD5 ADC input operation
4	P4	RW	0x0	Port C 4 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD4 ADC input operation
3	P3	RW	0x0	Port C 3 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD3 ADC input operation
2	P2	RW	0x0	Port C 2 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD2 ADC input operation
1	P1	RW	0x0	Port C 1 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD1 ADC input operation
0	P0	RW	0x0	Port C 0 input enable 1b: input enabled, for I/O operation 0b: input disabled, for AD0 ADC input operation

8.1.6. GPIOCINTP

Register 8-5. GPIOCINTP (GPIO Port C Interrupt Polarity, 0x4008 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port C 7 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
6	P6	RW	0x0	Port C 6 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
5	P5	RW	0x0	Port C 5 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
4	P4	RW	0x0	Port C 4 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
3	P3	RW	0x0	Port C 3 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
2	P2	RW	0x0	Port C 2 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
1	P1	RW	0x0	Port C 1 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
0	P0	RW	0x0	Port C 0 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition

8.1.7. GPIOCINTE

Register 8-6. GPIOCINTE (GPIO Port C Interrupt Enable, 0x4008 0024)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port C 7 interrupt enable 1b: enabled interrupt 0b: disable interrupt
6	P6	RW	0x0	Port C 6 interrupt enable 1b: enabled interrupt 0b: disable interrupt
5	P5	RW	0x0	Port C 5 interrupt enable 1b: enabled interrupt 0b: disable interrupt
4	P4	RW	0x0	Port C 4 interrupt enable 1b: enabled interrupt 0b: disable interrupt
3	P3	RW	0x0	Port C 3 interrupt enable 1b: enabled interrupt 0b: disable interrupt
2	P2	RW	0x0	Port C 2 interrupt enable 1b: enabled interrupt 0b: disable interrupt

BIT	NAME	ACCESS	RESET	DESCRIPTION
1	P1	RW	0x0	Port C 1 interrupt enable 1b: enabled interrupt 0b: disable interrupt
0	P0	RW	0x0	Port C 0 interrupt enable 1b: enabled interrupt 0b: disable interrupt

8.1.8. GPIOCINTF

Register 8-7. GPIOCINTF (GPIO Port C Interrupt, 0x4008 0028)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port C 7 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
6	P6	RW	0x0	Port C 6 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
5	P5	RW	0x0	Port C 5 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
4	P4	RW	0x0	Port C 4 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
3	P3	RW	0x0	Port C 3 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending

1	P1	RW	0x0	Port C 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
0	P0	RW	0x0	Port C 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

8.2. Details of Operation

8.2.1. Block Diagram

Figure 8-1. GPIO Port C

8.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO C:

- Nested Vectored Interrupt Controller (NVIC)
- ADC

8.2.3. GPIO C Block

The GPIOC block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, High-Z output operation, analog ADx input to the ADC Mux. The GPIOC block IO voltage is different from the other GPIO blocks, it is supplied from VCC33.

8.2.4. Analog Input

The digital input state of GPIOC can be monitored with **GPIOCIN.Px** if **GPIOCINE.Px** is set.

Clear **GPIOCINE.Px** and **GPIOCOUTEN.Px** to disable digital input and output to allow use of analog input ADx to the ADC.

8.2.5. Output and Output Enable

When **GPIOCOUTEN.Px** is enabled, the output state is controlled by **GPIOCOUT.Px**.

When **GPIOCOUTEN.Px** is disabled, the output is in High-Z state.

8.2.6. Interrupt

The interrupt for each GPIO can be enabled with **GPIOCINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOCINTP**. The state of the interrupt can be read from **GPIOCINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOCINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

2	P2	RW	0x0	Port D 2 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
1	P1	RW	0x0	Port D 1 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition
0	P0	RW	0x0	Port D 0 interrupt polarity select 1b: Rising edge, low to high transition 0b: Falling edge, high to low transition

9.1.10. GPIODINTE

Register 9-9. GPIODINTE (GPIO Port D Interrupt Enable, 0x4008 0064)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port D 7 interrupt enable 1b: enabled interrupt 0b: disable interrupt
6	P6	RW	0x0	Port D 6 interrupt enable 1b: enabled interrupt 0b: disable interrupt
5	P5	RW	0x0	Port D 5 interrupt enable 1b: enabled interrupt 0b: disable interrupt
4	P4	RW	0x0	Port D 4 interrupt enable 1b: enabled interrupt 0b: disable interrupt
3	P3	RW	0x0	Port D 3 interrupt enable 1b: enabled interrupt 0b: disable interrupt
2	P2	RW	0x0	Port D 2 interrupt enable 1b: enabled interrupt 0b: disable interrupt

BIT	NAME	ACCESS	RESET	DESCRIPTION
1	P1	RW	0x0	Port D 1 interrupt enable 1b: enabled interrupt 0b: disable interrupt
0	P0	RW	0x0	Port D 0 interrupt enable 1b: enabled interrupt 0b: disable interrupt

9.1.11. GPIODINTF

Register 9-10. GPIODINTF (GPIO Port D Interrupt, 0x4008 0068)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port D 7 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
6	P6	RW	0x0	Port D 6 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
5	P5	RW	0x0	Port D 5 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
4	P4	RW	0x0	Port D 4 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
3	P3	RW	0x0	Port D 3 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
2	P2	RW	0x0	Port D 2 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
1	P1	RW	0x0	Port D 1 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending
0	P0	RW	0x0	Port D 0 interrupt 1b: interrupt pending, clear with write to 1b 0b: no interrupt pending

9.1.12. GPIODINTM

Register 9-11. GPIODINTM (GPIO Port D Interrupt Mask, 0x4008 006C)

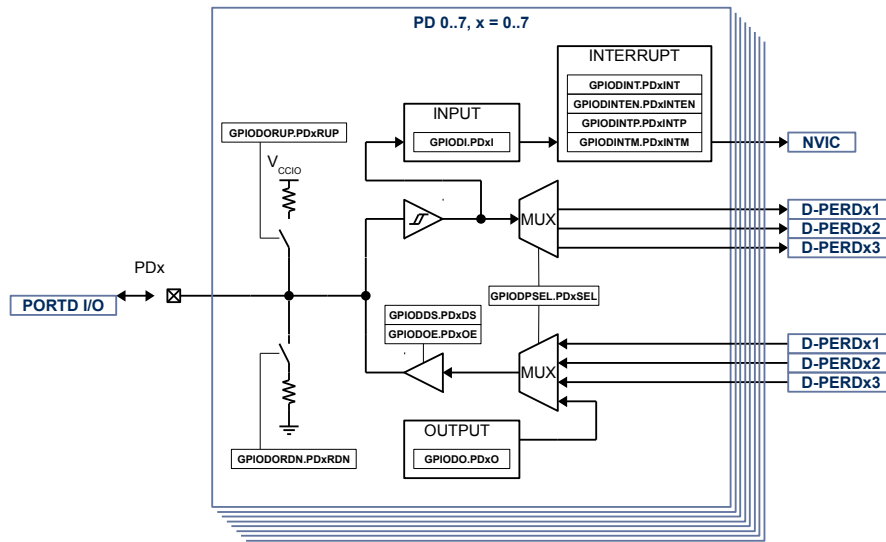

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port D 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
6	P6	RW	0x0	Port D 6 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

BIT	NAME	ACCESS	RESET	DESCRIPTION
5	P5	RW	0x0	Port D 5 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
4	P4	RW	0x0	Port D 4 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
3	P3	RW	0x0	Port D 3 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
2	P2	RW	0x0	Port D 2 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
1	P1	RW	0x0	Port D 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
0	P0	RW	0x0	Port D 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

9.2. Details of Operation

9.2.1. Block Diagram

Figure 9-1. GPIO Port D

9.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO D:

- Nested Vectored Interrupt Controller (NVIC)
- Gate Driver
- Timer A, PWMA, DTGA
- Timer B, PWMB, DTGB
- Timer C, PWMC, DTGC
- Timer D, PWMD, DTGD
- CCS
- SWD Debugger

9.2.3. GPIO D Block

The GPIO D block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation. Some of the GPIO can be configured as PWM output, or capture and compare input.

9.2.4. Input

The input state of GPIOD can be monitored with **GPIODIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIODPSEL**.

9.2.5. Output and Output Enable

When **GPIODOUTEN.Px** is enabled, the output state is controlled by **GPIODOUT.Px**.

When **GPIODOE.PDxOE** is disabled, the output is in High-Z state.

9.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIODDS** to meet application needs. Set **GPIODDS.Px** to enable high current drive strength, reset to enable low current drive strength.

9.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIODPU** and weak pull down can be enabled with **GPIODPD**.

NOTE:

GPIODPU.Px or **GPIODPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

9.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIODPSEL**. When a different function than IO is selected the input state can still be read with **GPIODIN** and the pull-up and pull-down is still controllable.

9.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIODINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIODINTP**. The state of the interrupt can be read from **GPIODINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIODINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

10. GPIO PORT E

10.1. Register

10.1.1. Register Map

Table 10-1. GPIO Port E Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
GPIO Port E			
0x4009 0000	GPIOEOUT	GPIO Port E output	0x0000 0000
0x4009 0004	GPIOEOUTEN	GPIO Port E output enable	0x0000 0000
0x4009 0008	GPIOEODS	GPIO Port E output drive strength	0x0000 0000

10.1.12. GPIOEINTM

Register 10-11. GPIOEINTM (GPIO Port E Interrupt Mask, 0x4009 002C)

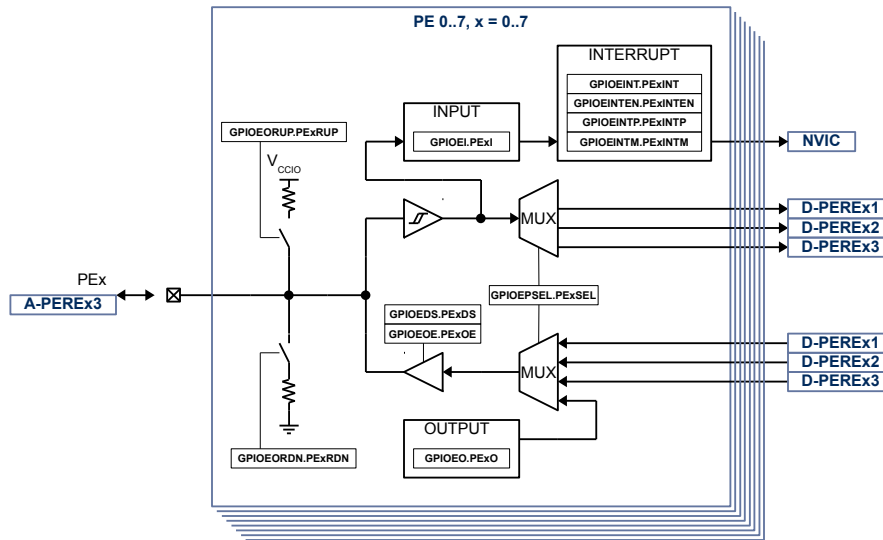

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	RO	0x0	Reserved
7	P7	RW	0x0	Port E 7 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
6	P6	RW	0x0	Port E 6 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

BIT	NAME	ACCESS	RESET	DESCRIPTION
5	P5	RW	0x0	Port E 5 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
4	P4	RW	0x0	Port E 4 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
3	P3	RW	0x0	Port E 3 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
2	P2	RW	0x0	Port E 2 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
1	P1	RW	0x0	Port E 1 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask
0	P0	RW	0x0	Port E 0 interrupt mask 1b: enable interrupt mask 0b: disable interrupt mask

10.2. Details of Operation

10.2.1. Block Diagram

Figure 10-1. GPIO Port E

10.2.2. Configuration

Following blocks need to be configured for correct use of the GPIO E:

- Nested Vectored Interrupt Controller (NVIC)
- SPI
- I2C
- UART

10.2.3. GPIO E Block

The GPIO E block consists of up to 8 general purpose input output (GPIO). Each GPIO has interrupt capabilities, weak pull-up or pull-down, programmable output drive strength, High-Z output operation.

10.2.4. Input

The input state of GPIOE can be monitored with **GPIOEIN.Px**. The input state can be monitored regardless of the peripheral select setting **GPIOEPSSEL**.

10.2.5. Output and Output Enable

When **GPIOEOUTEN.Px** is enabled, the output state is controlled by **GPIOEOUT.Px**.

When **GPIOEOUTEN.Px** is disabled, the output is in High-Z state.

10.2.6. Output Drive Strength

The output drive strength can be adjusted using **GPIOEDS** to meet application needs. Set **GPIOEDS.Px** to enable high current drive strength, reset to enable low current drive strength.

10.2.7. Weak Pull Up and Pull Down

Independent from the output settings, weak pull up can be enabled with **GPIOEPU** and weak pull down can be enabled with **GPIOPD**.

NOTE:

GPIOEPU.Px or **GPIOEPD.Px** should never be enabled at the same time for a single GPIO. If switching from weak pull-up to weak pull-down is required, disable weak pull-up first before enable weak pull-down and vice versa.

10.2.8. Peripheral Select

Each GPIO is connected to up to 4 digital peripherals, selectable with **GPIOEPSEL**. When a different function than IO is selected the input state can still be read with **GPIOEIN** and the pull-up and pull-down is still controllable.

10.2.9. Interrupt

The interrupt for each GPIO can be enabled with **GPIOEINTE**. The interrupt can be configured to be rising signal edge or falling signal edge using **GPIOEINTP**. The state of the interrupt can be read from **GPIOEINTF**. The individual interrupt bits can be cleared by writing to 1.

When the GPIO interrupts are enabled for the first time after device start-up, it may be in an uncertain state and generate an interrupt. To avoid this the **GPIOEINTM** mask bit need to be set before enabled interrupt bits.

To allow interrupt to be recognized by the CPU the GPIO interrupt need also be enabled in the NVIC.

11. GENERAL PURPOSE TIMER

11.1. Register

11.1.1. Register Map

Table 11-1. General Purpose Timer Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
Real Time Clock			
0x4004 0000	RTCCTL	Real-time clock timer control	0x6300 0000
0x4004 0004	RTCCDV	Real-time clock timer count-down value	0x63FF FFFF
0x4004 0008	RTCCTR	Real-time clock timer counter	0x00FF FFFF

11.1.2. RTCCTL

Register 11-1. RTCCTL (Real Time Clock Control, 0x4004 0000)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	KEY	RW	0x63	Key for writing GPTCTL register 0x4A: allow writes to GPTCTL register 0x63: read value of GPTCTL.KEY
23:12	Reserved	R	0x0	Reserved
11	WRBUSY	RW	0x0	GPTCTL write busy 1b = write to GPTCTL still being processed. Any register writes received while this bit is set to a 1b will be dropped and not written to the given register. Any reads will return indeterminate data. 0b = GPT registers not busy
10	Reserved	RW	0x0	Reserved, write as 0

5	Reserved	R	0x0	Reserved
4	GPTINT	RW	0x0	Real time clock interrupt 1b = GPT interrupt 0b = no GPT interrupt
3	GPTINTEN	RW	0x0	Real time clock interrupt enable 1b = enable GPT interrupt 0b = disable GPT interrupt

BIT	NAME	ACCESS	RESET	DESCRIPTION
2:0	GPTCTRRST	RW	0x0	GPTCTR counter reset 101b = write of 101b reset GPTCTR to GPTCDV value

11.1.3. RTCCDV

Register 11-2. RTCCDV (Real Time Clock Count-Down Value, 0x4004 0004)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	KEY	RW	0x63	Key for writing GPTCTL register 0x4A: allow writes to GPTCTL register 0x63: read value of GPTCTL.KEY
23:0	RSTVALUE	RW	0xFF FFFF	24bit GPT count-down value

11.1.4. RTCCTR

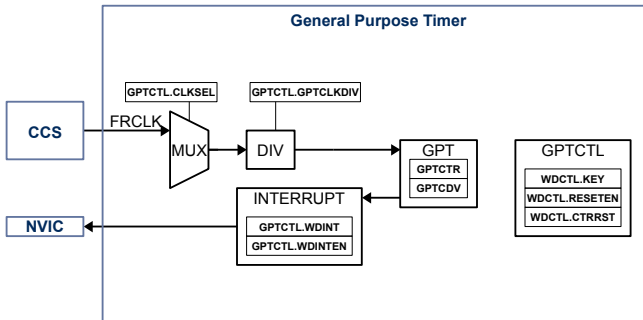

Register 11-3. RTCCTR (Real Time Clock Counter, 0x4004 0008)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	Reserved	R	0x0	Reserved
23:0	CTR	RW	0xFF FFFF	Current value of GPT

11.2. Details of Operation

11.2.1. Block Diagram

Figure 11-1. GPT

11.2.2. Configuration

Following blocks need to be configured for correct use of the GPT:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)

11.2.3. General Purpose Timer

The General purpose timer consist of a 24-bit timer, can also run in device sleep mode if FRLCK is used.

11.2.4. Access GPT Registers

The **RTCCTL** and **RTCCDV** registers can only be written to if **RTCCTL.KEY** or **RTCCDV.KEY** are set to 0x4A.

The read back value of **RTCCTL.KEY** or **RTCCDV.KEY** is always 0x63. The general purpose timer is supplied by the FRCLK. The GPT may divide this input clock by using the **RTCCTL.GPTCLKDIV**. Writing to any GPT registers may take up to 1 clock cycle on the GPT clock domain to finish. Any ongoing writes to GPT registers are shown with **RTCCTL.WRBUSY**. As long as **RTCCTL.WRBUSY** is 1b, any subsequent writes to GPT registers are ignored and reads only provide undetermined data.

11.2.5. GPT Clock

The GPT uses FRCLK as its input clock. For applications where the GPT need to run in CPU sleep mode, FRCLK should be used. The clock input can be further divided down from /2 to /65536 using **RTCCTL.GPTCLKDIV**.

11.2.6. General Purpose Timer Mode

Set **RTCCTL.GPTRESETEN** to 0b to use the GPT as general purpose 24-bit timer. Set the desired count value in GPT clocks in **RTCCDV.RSTVALUE**, set **RTCCTL.GPTCTRRST** to 101b to load **RTCCTR.CTR** with **RTCCDV.RSTVALUE**. To start the GPT timer set **RTCCTL.INTEN**. When **RTCCTR.CTR** reaches 0x0, the timer automatic reloads **RTCCTR.CTR** with **RTCCDV.RSTVALUE** and continues countdown. The GPT is stopped when **RTCCTL.INTEN** is cleared.

12. TIMER A

12.2. Details of Operation

12.2.1. Block Diagram

Figure 12-1. Timer A

12.2.2. Configuration

Following blocks need to be configured for correct use of the Timer A:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- I/O Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer B
- Timer C
- Timer D

12.2.3. Timer A Block

The timer A block consist of a 16-bit timer with up mode or up/down mode with 8 PWM/capture units and 4 dead-time generator units.

12.2.4. Timer

Once enabled the timer counts up to the Timer A period value **TAPRD**. The **TAPRD** register can be written to

while the timer is running, the new **TAPRD** value will be latched when the counter reaches old **TAPRD** value in up mode. In up/down mode there is the option to latch the new **TAPRD** value when counter counts back to zero. **TACTL.PRDL** configures when the timer will be updated with the new **TAPRD** value in up/down mode.

The current timer value is accessible with the timer A counter value register **TACTR**.

12.2.5. Register update

The **TAPRD**, **TACCxCTR** register can be written to while the timer is running, the new **TAPRD**, **TACCxCTR** value will be latched when the counter reaches old **TAPRD** value in up mode. In up/down mode there is the option to latch the new **TAPRD**, **TACCxCTR** values when counter counts back to zero. **TACTL.PRDL** configures when the timer will be updated with the new **TAPRD**, **TACCxCTR** value in up/down mode.

12.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TACTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TACTR** to zero use **TACTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TAPRD**. When the timer counter reaches the value of **TAPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TAPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

12.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TACTL.SS** the timer will only count to **TAPRD** value and stops in up mode. In up/down mode the timer will count to **TAPRD** and back to zero only once.

To start the timer in single-shot mode, **TACTL.SS** must be set. The timer will start when **TACTL.CLR** is set. To re-start a single-shot timer, **TACTL.CLR** must be reset, and then set again.

12.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TACTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TACTL.CLKDIV**.

12.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (**SYNC_IN**) and the synchronization out signal (**SYNC_OUT**).

Timer A can be synchronized with Timer B, C, and D with timer A as master.

The timer asserts the **SYNC_OUT** pulse when the **TACTL.CLR** bit is set and de-asserts the **SYNC_OUT** pulse when the **TACTL.CLR** bit is cleared.

Each timer B, C, or D that need to be synchronized as slave with master timer A need to set the **TxCTL.SYNC** bit. If this bit is not set, then the **sync_in** signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is asserted, the timer clears the timer counter. The

timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the **SYNC_IN** signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. All slave timers B, C, or D are configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TACTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TACTL.CLR** signal, to assert the **SYNC_OUT** signal. The timers can be re-enabled by clearing the **TACTL.CLR** bit, which de-asserts the **SYNC_OUT** signal.

12.2.10. PWM/Compare Units

Timer A supports up to 8 PWM/Capture units PWMA0 to PWMA7. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TACCxCTL.CCMODE**.

12.2.10.1. PWM Mode

The PWM mode is enabled with setting **TACCxCTRL.CCMODE** to 0.

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TACTR** value of 0 and then transitions to low when **TACTR** counts up to **TACCxCTR** compare value.

To configure a duty cycle of 0%, the **TACCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TACCxCTR** value should be set to a value greater than or equal to **TAPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 12-2. PWMA[x] and PWMA[x+4] Example Using Timer A Up Mode and Up/Down Mode

12.2.10.2. Capture Mode

The Capture mode is enabled with setting **TACCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TACCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TACTR** value is copied into **TACCxCTR**.

Figure 12-3. CA[x] and CA[x+4] Capture Example

12.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TACTL.INT** interrupt flag is set. If the interrupt is enabled using the **TACTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TACTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TACCxCTL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TACCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TACCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TACTL.INT** or **TACCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

12.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer A block supports up to 4 dead time generators.

12.2.12.1. Dead Time Input Clock Selection

The clock source for the DTG_x can be selected using **TACTL.DTGCLK**.

Clear **TACTL.DTGCLK** to 0 to use clock source selected by **TACTL.CLK** directly to use higher resolution for dead time insertion.

Set **TACTL.DTGCLK** to 1 to use divided clock source selected by **TACTL.CLK** and **TACTL.CLKDIV** divider to use the same dead time resolution as Timer A.

12.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently for each DTG using **DTG_xLED** and **DTG_xTED**.

12.2.12.3. Bypass Mode

Set **DTG_xCTL.BYPASS** to 0 to enable dead time insertion.

Set **DTG_xCTL.BYPASS** to 1 to enable bypass mode, no deadtime is inserted, PWMA_[x+4] is routed to DTG_xHS and PWMA_x is routed to DTG_xLS.

The DTG_xHS and DTG_xLS signals can be inverted in bypass mode.

Figure 12-4. DTG_x Bypass Example

12.2.12.4. Inverting PWM Signal

The DTG output signals DTG_xHS and DTG_xLS can be inverted independently.

Set **DTG_xCTL.INVHS** to invert DTG_xHS signal.

Set **DTG_xCTL.INVLS** to invert DTG_xLS signal.

Figure 12-5. DTGx Bypass and Inverting LS Example

12.2.12.5. Dead Time Insertion

Set **DTGxCTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWM[x+4] signal is used to generate DTGxHS and DTGxLS. PWMA[x] signal is ignored and can be used for other purposes.

Set **DTGxLED** for desired leading-edge and **DTGxTED** for desired trailing edge in clock-cycles defined by **TACTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGxLS signal is automatically inverted compared to PWM[x+4] signal. Set **DTGxCTL.INVLS** to 0, if this is desired behavior.

Figure 12-6. DTGx LED and TED Example

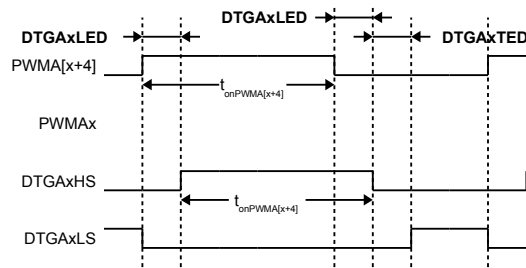

12.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGxCTL.OTP** to 1 to enable on time preservation. In this mode the DTGxHS is same as PWM[x+4] on time.

NOTE:

In dead time insertion mode the DTGxLS signal is automatically inverted compared to PWMA[x+4] signal. Set **DTGxCTL.INVLS** to 0, if this is desired behavior.

Figure 12-7. DTGx LED and TED with On Time Preservation Example

12.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGxHS, DTGxLS outputs, and CAx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

Table 12-2. Timer A Signal to Pin Mapping

PWM	CAPTURE	DEADTIME	PINS

13.1.14. DTGB0LED

Register 13-13. DTGB0LED (Timer B Dead Time Generator 0 Leading Edge Delay, 0x400E 00A4)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:12	Reserved	RO	0x0	Reserved
11:0	LED	RW	0x0	Counter value DTGB0 leading edge dead time in clock cycles defined by TBCTL.DTGCLK

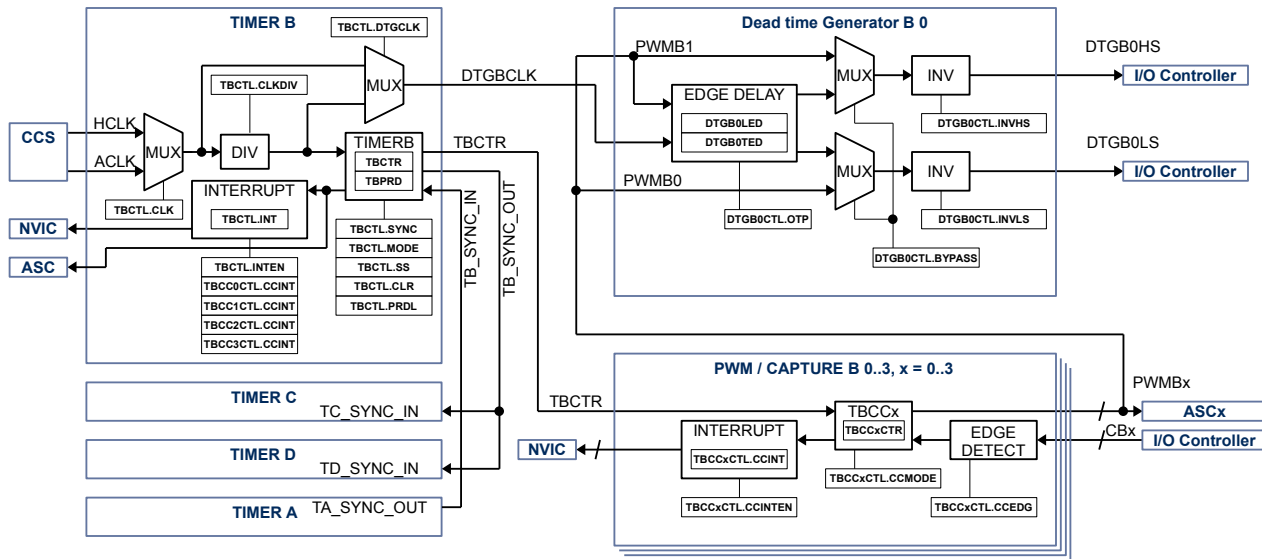

13.1.15. DTGB0TED**Register 13-14. DTGB0TED (Timer B Dead Time Generator 0 Trailing Edge Delay, 0x400E 00A8)**

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:12	Reserved	RO	0x0	Reserved
11:0	TED	RW	0x0	Counter value DTGB0 trailing edge dead time in clock cycles defined by TBCTL.DTGCLK

13.2. Details of Operation

13.2.1. Block Diagram

Figure 13-1. Timer B

13.2.2. Configuration

Following blocks need to be configured for correct use of the Timer B:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer C
- Timer D
-

13.2.3. Timer B Block

The timer B block consist of a 16-bit timer with up mode or up/down mode with 4 PWM/capture units and 1 dead-time generator unit.

13.2.4. Timer

Once enabled the timer counts up to the Timer B period value **TBPRD**. The **TBPRD** register can be written to while the timer is running, the new **TBPRD** value will be latched when the counter reaches old **TBPRD** value in up mode. In up/down mode there is the option to latch the new **TBPRD** value when counter counts back to zero.

TBCTL.PRDL configures when the timer will be updated with the new **TBPRD** value in up/down mode.

The current timer value is accessible with the timer B counter value register **TBCTR**.

13.2.5. Register update

The **TBPRD**, **TBCCxCTR** register can be written to while the timer is running, the new **TBPRD**, **TBCCxCTR** value will be latched when the counter reaches old **TBPRD** value in up mode. In up/down mode there is the option to latch the new **TBPRD**, **TBCCxCTR** values when counter counts back to zero. **TBCTL.PRDL** configures when the timer will be updated with the new **TBPRD**, **TBCCxCTR** value in up/down mode.

13.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TBCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TBCTR** to zero use **TBCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TBPRD**. When the timer counter reaches the value of **TBPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TBPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down.

13.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TBCTL.SS** the timer will only count to **TBPRD** value and stops in up mode. In up/down mode the timer will count to **TBPRD** and back to zero only once.

To start the timer in single-shot mode, **TBCTL.SS** must be set. The timer will start when **TBCTL.CLR** is set. To re-start a single-shot timer, **TBCTL.CLR** must be reset, and then set again.

13.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TBCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TBCTL.CLKDIV**.

13.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (**SYNC_IN**) and the synchronization out signal (**SYNC_OUT**).

Timer B can be synchronized with Timer C, and D with timer B as master. Timer B can be synchronized with Timer A as slave.

The timer asserts the **SYNC_OUT** pulse when the **TBCTL.CLR** bit is set and de-asserts the **SYNC_OUT** pulse when the **TBCTL.CLR** bit is cleared.

Each timer C, or D that need to be synchronized as slave with master timer B need to set the **TxCTL.SYNC** bit. If this bit is not set, then the sync_in signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the SYNC_IN signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. All slave timers B, C, or D are configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, or B is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.
- 6.

13.2.10. PWM/Compare Units

Timer B supports up to 4 PWM/Capture units PWMB0 to PWMB3. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TBCCxCTRL.CCMODE**.

13.2.10.1. PWM Mode

The PWM mode is enabled with setting **TBCCxCTRL.CCMODE** to 0.

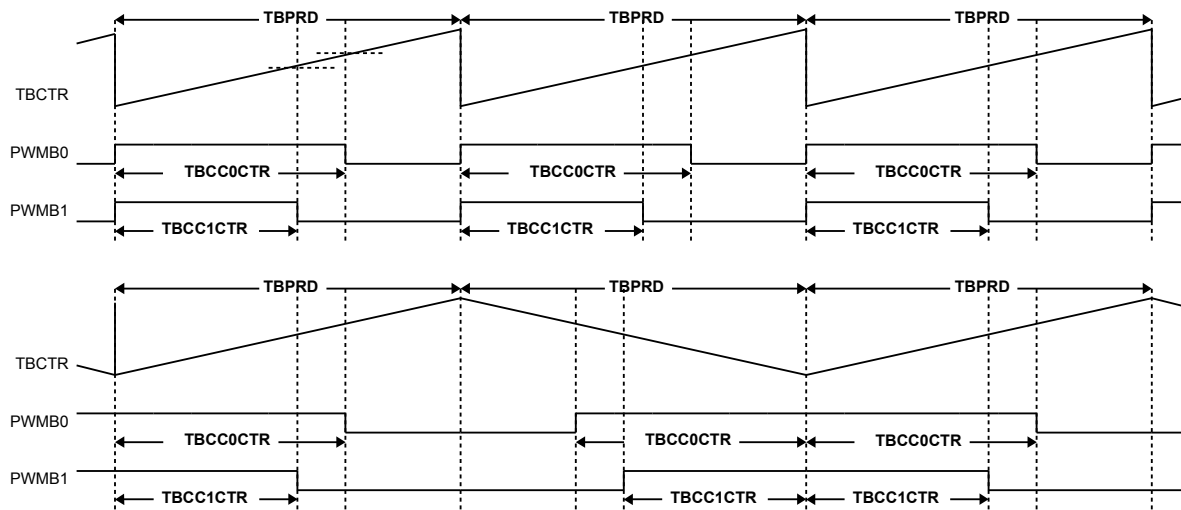

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TBCTR** value of 0 and then transitions to low when **TBCTR** counts up to **TBCCxCTR** compare value.

To configure a duty cycle of 0%, the **TBCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TBCCxCTR** value should be set to a value greater than or equal to **TBPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 13-2. PWMB0 and PWMB1 Example Using Timer B Up Mode and Up/Down Mode

13.2.10.2. Capture Mode

The Capture mode is enabled with setting **TBCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TBCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TBCTR** value is copied into **TBCCxCTR**.

Figure 13-3. CB0 and CB1 Capture Example

13.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TBCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TBCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TBCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TBCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TBCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TBCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TBCTL.INT** or **TBCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

13.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer B block supports up to 1 dead time generator.

13.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGB0 can be selected using **TBCTL.DTGCLK**.

Clear **TBCTL.DTGCLK** to 0 to use clock source selected by **TBCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TBCTL.DTGCLK** to 1 to use divided clock source selected by **TBCTL.CLK** and **TBCTL.CLKDIV** divider to use the same dead time resolution as Timer B.

13.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGB0LED** and **DTGB0TED**.

13.2.12.3. Bypass Mode

Set **DTGB0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGB0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWMB1 is routed to DTGB0HS and PWMB0 is routed to DTGB0LS.

The DTGB0HS and DTGB0LS signals can be inverted in bypass mode.

Figure 13-4. DTGB0 Bypass Example

13.2.12.4. Inverting PWM Signal

The DTG output signals DTGB0HS and DTGB0LS can be inverted independently.

Set **DTGB0CTL.INVHS** to invert DTGB0HS signal.

Set **DTGB0CTL.INVLS** to invert DTGB0LS signal.

Figure 13-5. DTGB0 Bypass and Inverting LS Example

13.2.12.5. Dead Time Insertion

Set **DTGB0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWMB1 signal is used to generate DTGB0HS and DTGB0LS. PWMB0 signal is ignored and can be used for other purposes.

Set **DTGB0LED** for desired leading-edge and **DTGB0TED** for desired trailing edge in clock-cycles defined by **TBCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGB0LS signal is automatically inverted compared to PWMB1 signal. Set **DTGB0CTL.INVLS** to 0, if this is desired behavior.

Figure 13-6. DTGB0 LED and TED Example

13.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGB0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGB0HS is same as PWMB1 on time.

NOTE:

In dead time insertion mode the DTGB0LS signal is automatically inverted compared to PWMB1 signal. Set **DTGB0CTL.INVLS** to 0, if this is desired behavior.

Figure 13-7. DTGB0 LED and TED with On Time Preservation Example

13.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGB0HS, DTGB0LS outputs, and CBx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

Table 13-2. Timer B Signal to Pin Mapping

PWM	CAPTURE	DEADTIME	PINS
PWMB0	CB0	DTGB0LS	PA3, PA6, PD2

14.2. Details of Operation

14.2.1. Block Diagram

Figure 14-1. Timer C

14.2.2. Configuration

Following blocks need to be configured for correct use of the Timer C:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer B
- Timer D
-

14.2.3. Timer C Block

The timer C block consist of a 16-bit timer with up mode or up/down mode with 2 PWM/capture units and 1 dead-time generator unit.

14.2.4. Timer

Once enabled the timer counts up to the Timer C period value **TCPRD**. The **TCPRD** register can be written to while the timer is running, the new **TCPRD** value will be latched when the counter reaches old **TCPRD** value in up mode. In up/down mode there is the option to latch the new **TCPRD** value when counter counts back to zero.

TCCTL.PRDL configures when the timer will be updated with the new **TCPRD** value in up/down mode.

The current timer value is accessible with the timer C counter value register **TCCTR**.

14.2.5. Register update

The **TCPRD**, **TCCCxCTR** register can be written to while the timer is running, the new **TCPRD**, **TCCCxCTR** value will be latched when the counter reaches old **TCPRD** value in up mode. In up/down mode there is the option to latch the new **TCPRD**, **TCCCxCTR** values when counter counts back to zero. **TCCTL.PRDL** configures when the timer will be updated with the new **TCPRD**, **TCCCxCTR** value in up/down mode.

14.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TCCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TCCTR** to zero use **TCCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TCPRD**. When the timer counter reaches the value of **TCPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TCPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

14.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TCCTL.SS** the timer will only count to **TCPRD** value and stops in up mode. In up/down mode the timer will count to **TCPRD** and back to zero only once.

To start the timer in single-shot mode, **TCCTL.SS** must be set. The timer will start when **TCCTL.CLR** is set. To re-start a single-shot timer, **TCCTL.CLR** must be reset, and then set again.

14.2.8. Input clock and Pre-scaler

The timer can be configured to use HCLK or ACLK using **TCCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TCCTL.CLKDIV**.

14.2.9. Timer synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (**SYNC_IN**) and the synchronization out signal (**SYNC_OUT**).

Timer C can be synchronized with Timer D as master. Timer B can be synchronized with Timer A, and B as slave.

The timer asserts the **SYNC_OUT** pulse when the **TCCTL.CLR** bit is set and de-asserts the **SYNC_OUT** pulse when the **TCCTL.CLR** bit is cleared.

If timer D that need to be synchronized as slave with master timer C need to set the **TxCTL.SYNC** bit. If this is bit is not set, then the sync_in signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the SYNC_IN signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the SYNC_IN signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. The slave timer C, D is configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, or B is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.

14.2.10. PWM/Compare Units

Timer C supports up to 2 PWM/Capture units PWMC0 to PWMC1. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TCCxCTL.CCMODE**.

14.2.10.1. PWM Mode

The PWM mode is enabled with setting **TCCxCTRL.CCMODE** to 0.

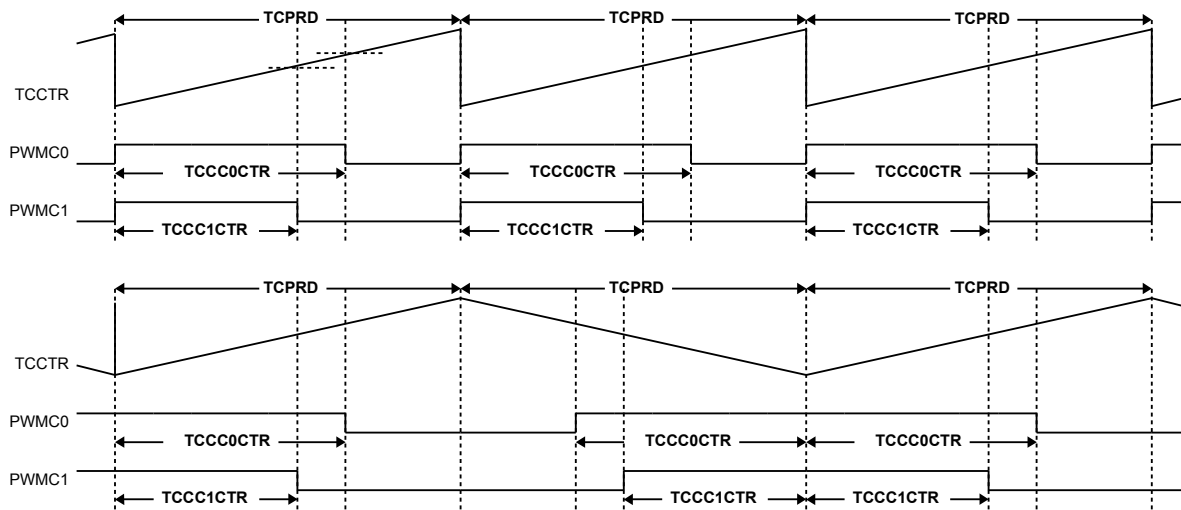

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TCCTR** value of 0 and then transitions to low when **TCCTR** counts up to **TCCxCTR** compare value.

To configure a duty cycle of 0%, the **TCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TCCxCTR** value should be set to a value greater than or equal to **TCPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 14-2. PWMC0 and PWMC1 Example Using Timer C Up Mode and Up/Down Mode

14.2.10.2. Capture Mode

The Capture mode is enabled with setting **TCCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TCCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TCCTR** value is copied into **TCCCxCTR**.

Figure 14-3. CC0 and CC1 Capture Example

14.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TCCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TCCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TCCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TCCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TCCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TCCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TCCTL.INT** or **TCCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

14.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer C block supports up to 1 dead time generator.

14.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGC0 can be selected using **TCCTL.DTGCLK**.

Clear **TCCTL.DTGCLK** to 0 to use clock source selected by **TCCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TCCTL.DTGCLK** to 1 to use divided clock source selected by **TCCTL.CLK** and **TCCTL.CLKDIV** divider to use the same dead time resolution as Timer C.

14.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGC0LED** and **DTGC0TED**.

14.2.12.3. Bypass Mode

Set **DTGC0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGC0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWMC1 is routed to DTGC0HS and PWMC0 is routed to DTGC0LS.

The DTGC0HS and DTGC0LS signals can be inverted in bypass mode.

Figure 14-4. DTGC0 Bypass Example

14.2.12.4. Inverting PWM Signal

The DTG output signals DTGC0HS and DTGC0LS can be inverted independently.

Set **DTGC0CTL.INVHS** to invert DTGC0HS signal.

Set **DTGC0CTL.INVLS** to invert DTGC0LS signal.

Figure 14-5. DTGC0 Bypass and Inverting LS Example

14.2.12.5. Dead Time Insertion

Set **DTGC0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWM1 signal is used to generate DTGC0HS and DTGC0LS. PWM0 signal is ignored and can be used for other purposes.

Set **DTGC0LED** for desired leading-edge and **DTGC0TED** for desired trailing edge in clock-cycles defined by **TCCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGC0LS signal is automatically inverted compared to PWM1 signal. Set **DTGC0CTL.INVLS** to 0, if this is desired behavior.

Figure 14-6. DTGC0 LED and TED Example

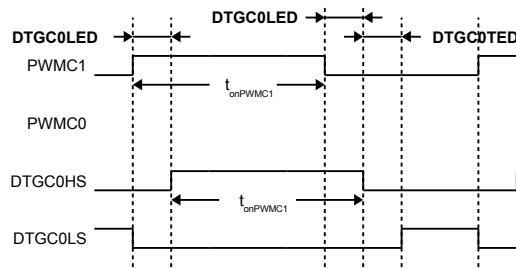

14.2.12.6. Dead Time Insertion With On Time Preservation

Set **DTGC0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGC0HS is same as PWM1 on time.

NOTE:

In dead time insertion mode the DTGC0LS signal is automatically inverted compared to PWM1 signal. Set **DTGC0CTL.INVLS** to 0, if this is desired behavior.

Figure 14-7. DTGC0 LED and TED with On Time Preservation Example

14.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGC0HS, DTGC0LS outputs, and CCx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

11:0	TED	RW	0x0	Counter value DTGD0 trailing edge dead time in clock cycles defined by TDCTL.DTGCLK

15.2. Details of Operation

15.2.1. Block Diagram

Figure 15-1. Timer D

15.2.2. Configuration

Following blocks need to be configured for correct use of the Timer D:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- Gate Driver
- Auto sequencing controller (ASC)
- Timer A
- Timer B
- Timer C

15.2.3. Timer D Block

The timer D block consist of a 16-bit timer with up mode or up/down mode with 2 PWM/capture units and 1 dead-time generator unit.

15.2.4. Timer

Once enabled the timer counts up to the Timer D period value **TDPRD**. The **TDPRD** register can be written to while the timer is running, the new **TDPRD** value will be latched when the counter reaches old **TDPRD** value in up mode. In up/down mode there is the option to latch the new **TDPRD** value when counter counts back to zero. **TDCTL.PRD** configures when the timer will be updated with the new **TDPRD** value in up/down mode.

The current timer value is accessible with the timer D counter value register **TDCTR**.

15.2.5. Register Update

The **TDPRD**, **TDCCxCTR** register can be written to while the timer is running, the new **TDPRD**, **TDCCxCTR** value will be latched when the counter reaches old **TDPRD** value in up mode. In up/down mode there is the option to latch the new **TDPRD**, **TDCCxCTR** values when counter counts back to zero. **TDCTL.PRDL** configures when the timer will be updated with the new **TDPRD**, **TDCCxCTR** value in up/down mode.

15.2.6. Timer Modes

The timer supports 3 modes of operation: disabled, up and up/down using **TDCTL.MODE**.

By default, the timer mode is disabled. When the timer is disabled, the timer counter does not increment or decrement. If the timer is disabled when previously in up or up/down mode, then the timer counter stops where it is. If the timer is re-enabled by putting it back into up or up/down modes, then the counter continues from the point at which it was disabled. To reset the current counter value **TDCTR** to zero use **TDCTL.CLR**.

In up mode, the timer starts counting from 0 up to the value of **TDPRD**. When the timer counter reaches the value of **TDPRD**, then the timer counter is reset to a value of 0. This mode is typically used for timed events or edge-aligned PWM output.

In up/down mode, the timer starts counting from 0 up to the value of **TDPRD**, and then back down to a value of 0. This timer mode is typically used for center-aligned PWM output. It can also be used for timed events, and will allow a longer timer range due to the fact it counts up and down

15.2.7. Single Shot Mode

The timer can be configured to run either once or continuously.

When the timer is configured in single shot mode using **TDCTL.SS** the timer will only count to **TDPRD** value and stops in up mode. In up/down mode the timer will count to **TDPRD** and back to zero only once.

To start the timer in single-shot mode, **TDCTL.SS** must be set. The timer will start when **TDCTL.CLR** is set. To re-start a single-shot timer, **TDCTL.CLR** must be reset, and then set again.

15.2.8. Input Clock And Pre-Scaler

The timer can be configured to use HCLK or ACLK using **TDCTL.CLK**. The input clock for the can be divided further down from /1 to /128 using the **TDCTL.CLKDIV**.

15.2.9. Timer Synchronization

The Timer A, B, C, D in the system have the ability to have synchronization between them. Each timer has a synchronization in signal (**SYNC_IN**) and the synchronization out signal (**SYNC_OUT**).

Timer D can be synchronized with Timer A, B, or C as slave.

The timer asserts the **SYNC_OUT** pulse when the **TDCTL.CLR** bit is set and de-asserts the **SYNC_OUT** pulse when the **TDCTL.CLR** bit is cleared.

If timer D that need to be synchronized as slave with master timer C need to set the **TxCTL.SYNC** bit. If this is bit is not set, then the **sync_in** signal is ignored and the timer operates independently.

When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is asserted, the timer clears the timer counter. The timer counter is also cleared anytime the **TxCTL.CLR** bit is set to a 1. When the **TxCTL.SYNC** bit is set and the **SYNC_IN** signal is de-asserted and the timer mode is either up or up/down, then the timer will start counting. The timer will not start counting when the mode is set to up or up/down unless the **SYNC_IN** signal is de-asserted when **TxCTL.SYNC** is set.

NOTE:

In order for this feature to work correctly, all timers that are synchronized must be set to the same mode (up or up/down), with the same timer pre-scaler, timer clock input and timer period.

To enable synchronized timers, the following steps should be followed:

1. The slave timer B, C, D is configured with the selected timer input clock, timer pre-scaler, timer period and set the **TxCTL.SYNC** bit. The timer should still be set to disabled at this point.
2. The master timer A, B or C is configured with the same timer input clock, timer pre-scaler, timer period and sets the **TxCTL.CLR** bit. This should clear all timer counters of the master and slave timers.
3. The slave timers set the timer mode to the desired state (either up or up/down).
4. The master timer sets the timer mode to either up or up/down and clears the **TxCTL.CLR** bit. This should start the master and all slave timers simultaneously based on the selected timer clock input.
5. Once configured as above, all timers can be disabled by the master setting **TxCTL.CLR** signal, to assert the SYNC_OUT signal. The timers can be re-enabled by clearing the **TxCTL.CLR** bit, which de-asserts the SYNC_OUT signal.

15.2.10. PWM/Compare Units

Timer D supports up to 2 PWM/Capture units PWMD0 to PWMD1. Each PWM/Compare unit can be configured independently in PWM mode or capture mode using **TDCCxCTL.CCMODE**.

15.2.10.1. PWM Mode

The PWM mode is enabled with setting **TDCCxCTRL.CCMODE** to 0.

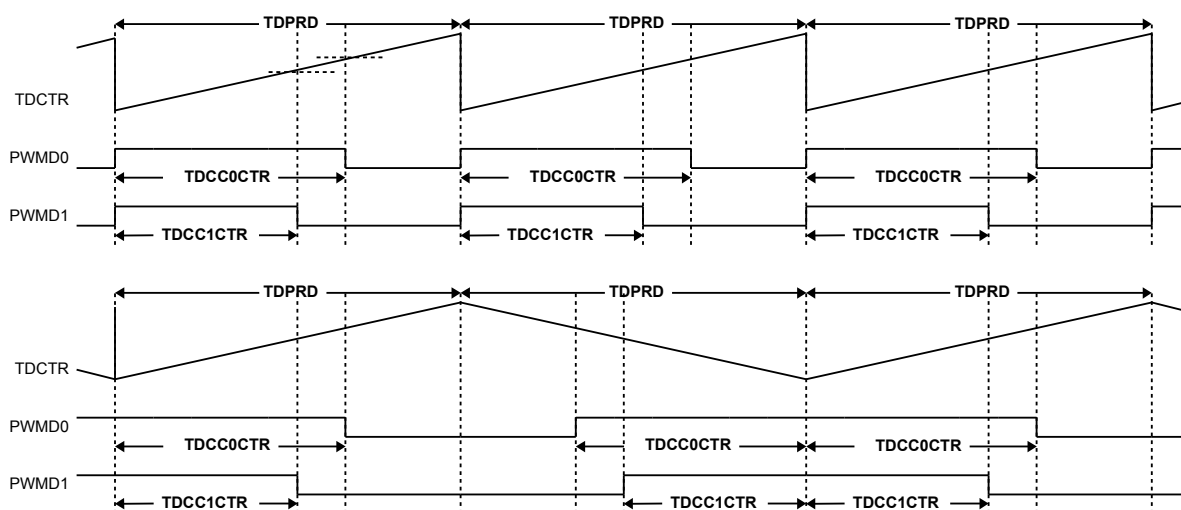

The timer configuration allows either edge-aligned (timer in up mode) or center-aligned (timer in up/down mode) modes of PWM operation.

In both edge-aligned and center-aligned modes of operation, the timer block outputs a PWM waveform that starts out high at a **TDCTR** value of 0 and then transitions to low when **TDCTR** counts up to **TDCCxCTR** compare value.

To configure a duty cycle of 0%, the **TDCCxCTR** should be set to 0; to configure a duty cycle of 100%, the **TDCCxCTR** value should be set to a value greater than or equal to **TDPRD**.

The polarity of the timer PWM outputs are not configurable. Adjustments to the polarity of the PWM outputs may be adjusted in the Dead-Time Generator (DTG) unit connected to the timer peripheral for each output independently.

Figure 15-2. PWMD0 and PWMD1 Example Using Timer D Up Mode and Up/Down Mode

15.2.10.2. Capture Mode

The Capture mode is enabled with setting **TDCCxCTRL.CCMODE** to 1. The trip condition for capture mode can be configured using **TDCCxCTRL.CCEDGE**, high-to-low signal edge transition, low-to-high signal edge transition or both.

When trip condition is detected the actual **TDCTR** value is copied into **TDCCxCTR**.

Figure 15-3. CD0 and CD1 Capture Example

15.2.11. Timer and PWM/Capture Interrupt

The timer may generate interrupt based on the base timer wrap, or when a capture and compare event occurs.

In the base timer both up and up/down timer modes allow an interrupt to be generated when the count reaches 0. Each time the count reaches zero, the **TDCTL.INT** interrupt flag is set. If the interrupt is enabled using the **TDCTL.INTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TDCTL.INT** interrupt flag bit.

In the capture and compare PWM units, each time a compare threshold is reached or each time a capture event is detected the **TDCCxCTRL.CCINT** bit will be set for that particular timer unit. If the interrupt is enabled via the **TDCCxCTRL.CCINTEN**, then the Timer IRQ signal will be asserted to the CPU. The interrupt flag may be cleared by writing a 1 to the **TDCCxCTRL.CCINT** interrupt flag bit.

The timer IRQ signal will be asserted if any of the timer interrupt flags **TDCTL.INT** or **TDCCxCTRL.CCINT** are set. The Timer IRQ signal will be de-asserted when all of the timer interrupt flags are cleared.

15.2.12. Dead-Time Generator

The dead-time generator can be configured to introduce dead-time for a complementary PWM output. The Timer D block supports up to 1 dead time generator.

15.2.12.1. Dead Time Input Clock Selection

The clock source for the DTGD0 can be selected using **TDCTL.DTGCLK**.

Clear **TDCTL.DTGCLK** to 0 to use clock source selected by **TDCTL.CLK** directly to use higher resolution for dead time insertion.

Set **TDCTL.DTGCLK** to 1 to use divided clock source selected by **TDCTL.CLK** and **TDCTL.CLKDIV** divider to use the same dead time resolution as Timer D.

15.2.12.2. Dead Time Range

The resolution for leading edge and trailing edge dead time is 12bits. Leading and trailing edge can be set independently using **DTGD0LED** and **DTGD0TED**.

15.2.12.3. Bypass Mode

Set **DTGD0CTL.BYPASS** to 0 to enable dead time insertion.

Set **DTGD0CTL.BYPASS** to 1 to enable bypass mode, no dead time is inserted, PWMD1 is routed to DTGD0HS and PWMD0 is routed to DTGD0LS.

The DTGD0HS and DTGD0LS signals can be inverted in bypass mode.

Figure 15-4. DTGD0 Bypass Example

15.2.12.4. Inverting PWM Signal

The DTG output signals DTGD0HS and DTGD0LS can be inverted independently.

Set **DTGD0CTL.INVHS** to invert DTGD0HS signal.

Set **DTGD0CTL.INVLS** to invert DTGD0LS signal.

Figure 15-5. DTGD0 Bypass and Inverting LS Example

15.2.12.5. Dead Time Insertion

Set **DTGD0CTL.BYPASS** to 0 to enable dead time insertion. In dead time insertion mode only PWMD1 signal is used to generate DTGD0HS and DTGD0LS. PWMD0 signal is ignored and can be used for other purposes.

Set **DTGD0LED** for desired leading-edge and **DTGD0TED** for desired trailing edge in clock-cycles defined by **TDCTL.DTGCLK** clock source

NOTE:

In dead time insertion mode the DTGD0LS signal is automatically inverted compared to PWMD1 signal. Set **DTGD0CTL.INVLS** to 0, if this is desired behavior.

Figure 15-6. DTGD0 LED and TED Example

15.2.12.6. Dead Time Insertion with On Time Preservation

Set **DTGD0CTL.OTP** to 1 to enable on time preservation. In this mode the DTGD0HS is same as PWMD1 on time.

NOTE:

In dead time insertion mode the DTGD0LS signal is automatically inverted compared to PWMD1 signal. Set **DTGD0CTL.INVLS** to 0, if this is desired behavior.

Figure 15-7. DTGD0 LED and TED with On Time Preservation Example

15.2.13. PWM Output and Capture Input Pin Selection

Each of the DTGD0HS, DTGD0LS outputs, and CDx inputs can be routed to different I/Os, allowing great flexibility in pin assignments.

In capture mode only one I/O should be enabled as input to the capture. If more than one pin input is enabled, the capture might not work properly.

Note:

Not all pins are available pending package option, consult data sheet for available pins and signals.

16.1.5. FLASHPERASE

Register 16-4. FLASHPERASE (FLASH Page Erase, 0x4002 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	PERASE	R	0x0	Write of correct key value to this register starts FLASH page erase selected in FLASHPAGE.PAGE 0xA5A5 5A5A: start FLASH page erase selected by FLASHPAGE.PAGE

16.1.6. SWDACCESS

Register 16-5. SWDACCESS (SDW Access Status, 0x4002 0024)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	DEBUG	R	0x0	Status of SWD debug 0xFFFFFFFF: SWD access is enabled 0x69696969: SWD access is disabled

16.1.7. FLASHWSTATE

Register 16-6. FLASHWSTATE (FLASH Access Wait State, 0x4002 0028)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:2	Reserved	RW	0x0	Reserved, must be set to 0x0
1:0	WSTATE	RW	0x3	FLASH access wait state 11b: 3 wait states for 75MHz < HCLK < 100MHz 10b: 2 wait states for 50MHz < HCLK < 75MHz 01b: 1 wait state for 25MHz < HCLK < 50MHz 00b: 0 wait state for HCLK < 25MHz

16.1.8. FLASHBWRITE

Register 16-7. FLASHBWRITE (Buffered FLASH Write, 0x4002 002C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	BWRITE	RW	0x0	Write of correct key value to this register starts buffered write operation 0xCA72 6B18: start buffered write of FLASHBWDATA

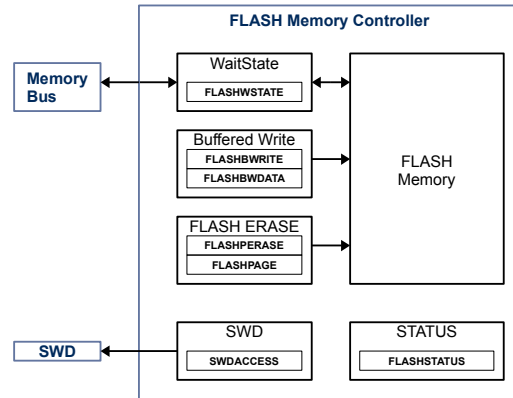

16.1.9. FLASHBWDATA
Register 16-8. FLASHBWDATA (Buffered FLASH Write Data, 0x4002 0030)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31	Reserved	RW	0x0	Reserved, must be set to 0x0
30	Reserved	RW	0x0	Reserved, must be set to 0x0
29:25	PAGE	RW	0x0	FLASH page selector to write to 0x1F: page 31, 0x0000 7C00 to 0x0000 7FFF 0x1E: page 30, 0x0000 7800 to 0x0000 7BFF 0x1D: page 29, 0x0000 7400 to 0x0000 73FF 0x1C: page 28, 0x0000 7000 to 0x0000 73FF 0x1B: page 27, 0x0000 6C00 to 0x0000 6FFF 0x1A: page 26, 0x0000 6800 to 0x0000 6BFF 0x19: page 25, 0x0000 6400 to 0x0000 67FF 0x18: page 24, 0x0000 6000 to 0x0000 63FF 0x17: page 23, 0x0000 5C00 to 0x0000 5FFF 0x16: page 22, 0x0000 5800 to 0x0000 5BFF 0x15: page 21, 0x0000 5400 to 0x0000 57FF 0x14: page 20, 0x0000 5000 to 0x0000 53FF 0x13: page 19, 0x0000 4C00 to 0x0000 4FFF 0x12: page 18, 0x0000 4800 to 0x0000 4BFF 0x11: page 17, 0x0000 4400 to 0x0000 47FF 0x10: page 16, 0x0000 4000 to 0x0000 43FF 0x0F: page 15, 0x0000 3C00 to 0x0000 3FFF 0x0E: page 14, 0x0000 3800 to 0x0000 3BFF 0x0D: page 13, 0x0000 3400 to 0x0000 37FF 0x0C: page 12, 0x0000 3000 to 0x0000 33FF 0x0B: page 11, 0x0000 2C00 to 0x0000 2FFF 0x0A: page 10, 0x0000 2800 to 0x0000 2BFF 0x09: page 9, 0x0000 2400 to 0x0000 27FF 0x08: page 8, 0x0000 2000 to 0x0000 23FF 0x07: page 7, 0x0000 1C00 to 0x0000 1FFF 0x06: page 6, 0x0000 1800 to 0x0000 1BFF 0x05: page 5, 0x0000 1400 to 0x0000 17FF 0x04: page 4, 0x0000 1000 to 0x0000 13FF 0x03: page 3, 0x0000 0C00 to 0x0000 0FFF 0x02: page 2, 0x0000 0800 to 0x0000 0BFF 0x01: page 1, 0x0000 0400 to 0x0000 07FF 0x00: page 0, 0x0000 0000 to 0x0000 03FF
24:16	ADDRESS	RW	0x0	Relative half word address within selected FLASHBWDATA.PAGE
15:0	DATA	RW	0x0	Data to write

16.2. Details of Operation

16.2.1. Block Diagram

Figure 16-1. FLASH Memory Controller

16.2.2. Configuration

Following blocks need to be configured for correct use of the FLASH:

- Clock Control System (CCS)

16.2.3. FLASH Memory

The Flash memory controller allows configuration of the FLASH memory. FLASH wait states, FLASH erase, buffered FLASH write, and SWD debug access can be configured. The FLASH memory has up to 32 pages of 1kByte each.

16.2.4. Writing to FLASH Controller Registers

The FLASH Controller registers are write protected to reduce chances of accidental erase or modification of FLASH memory. Each write to a FLASH controller register is a 2 step process. The first step is to write the correct key into **FLASHLOCK** followed by a FLASH controller register write.

Without correct key any writes to FLASH controller register will be ignored. Flash controller reads are always possible.

16.2.5. FLASH Wait State

After device reset, the **FLASHWSTATE** is set to 0x3. To allow optimal FLASH access time without delay, the FLASH wait state need to be set according to HCLK frequency used. See register table for correct setting.

To write to **FLASHWSTATE** register, **FLASHLOCK** need to be set to 0x1234 5678.

16.2.6. FLASH Page Erase

To erase a page of FLASH memory, set **FLASHLOCK** to 0xAAAA AAAA first, then set **FLASHBWDATA.PAGE** to the page to be erased and then set **FLASHPERASE** to 0xA5A5 5A5A. The FLASH page operation will start, **FLASHCTL.PERASE** is set to 1b and any access to FLASH memory address space is stalled until erase operation is finished. **FLASHCTL.PERASE** is set to 0b when erase operation is finished.

It is not recommended to erase FLASH pages while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.7. Write to FLASH

Only half-word address aligned half-word writes are supported. To write a half word to FLASH memory, make sure the memory location is erased by doing a read, it should return 0xFFFF. Set **FLASHLOCK** to 0xAAAA AAAA first, then write a half-word to the memory address directly.

It is not recommended to write to FLASH while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.8. Buffered Write to FLASH

Only half-word address aligned half-word writes are supported. The FLASH memory controller also allows buffered write to FLASH, to allow CPU still react to interrupts or perform other tasks while waiting for FLASH write to finish when executing from SRAM.

To write a half word to FLASH memory, make sure the memory location is erased by doing a read, it should return 0xFFFF. Set **FLASHLOCK** to 0xAAAA AAAA first, then write to **FLASHBWDATA**, with **FLASHBWDATA.DATA** the half-word you want to write, and **FLASHBWDATA.PAGE** the page where the memory location resides and **FLASHBWDATA.ADDRESS** the relative address of the memory location.

The FLASH page operation will start, **FLASHCTL.WRITE** is set to 1b, AHB bus control will be given back to CPU to allow execution of other commands. Any access to FLASH memory while buffered write operation is active will stall. **FLASHCTL.WRITE** is set to 0b when buffered write operation is finished.

To calculate **FLASHBWDATA.PAGE** use:

$$PAGE = \frac{Memoryaddress}{pagesize} \quad (4)$$

Where:

PAGE: integer value for **FLASHBWDATA.PAGE**

Memoryaddress: Word memory address

pagesize: FLASH page size: 0x400

Then to calculate **FLASHBWDATA.ADDRESS** use:

$$ADDRESS = \frac{(Memoryaddress - PAGE * pagesize)}{2} \quad (5)$$

Where:

ADDRESS: integer value for **FLASHBWDATA.ADRESS**

PAGE: integer value for **FLASHBWDATA.PAGE**

Memoryaddress: Word memory address
pagesize: FLASH page size: 0x400

Example:

memoryaddress: 0x0000 0438

PAGE = $0x0000\ 0438 / 0x400 = 0x01$

ADDRESS = $(0x0000\ 0438 - 0x01 * 0x400) / 0x2 = 0x38 / 0x2 = 0x1C$

It is not recommended to write to FLASH while executing from FLASH as any access to FLASH is stalled until the erase operation is finished. Either execute from SRAM or use SWD debug interface.

16.2.9. SWD Debug Access Disable

The SWD debug access is enabled by default and can be disabled by a FUSE to prevent access of device memory.

Caution need to be taken. This action is not reversible.

To disable SWD set **FLASHLOCK** to 0xF983 62AB first, then write 0x6969 6969 to address 0x0010 0008 will disable the SWD debug access.

17.2. Details of Operation

17.2.1. Block Diagram

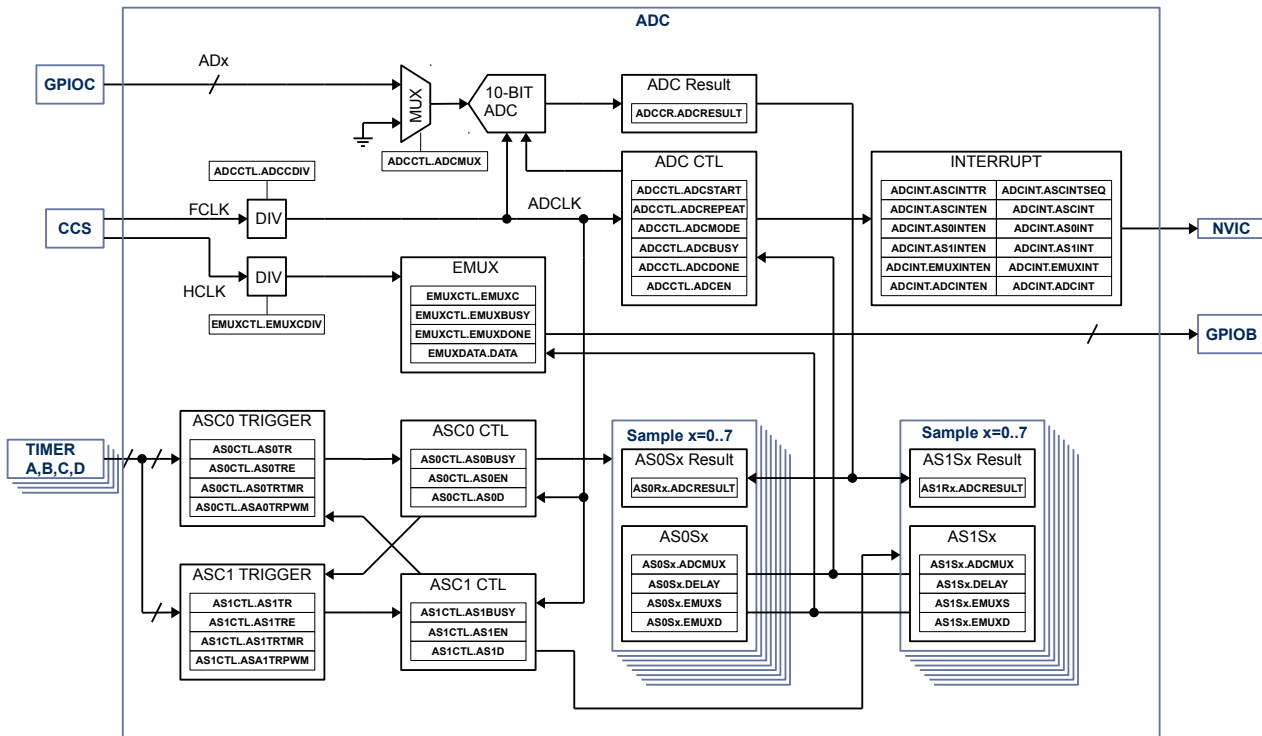

17.3. Details of Operation

17.3.1. Basic Configuration

Following blocks need to be configured for correct operation of the ADC

- CCS
- Timer A, B, C or D
- GPIOB
- GPIOC

Figure 17-1. ADC, EMUX, ASC0, ASC1

- NVIC

17.3.2. ADC, Autosequencer and EMUX

The ADC is a 10-bit SAR ADC. It can be used standalone or together with up to 2 independent low latency auto sequencer state machines to take series of up to 8 samples each into dedicated sample result registers, triggered by either PWM or timer signals. Each sample setup can be programmed with dedicated ADC-MUX setting and settling time delay. A dedicated, programmable high speed low latency communication interface is available to set analog both MUX, sample and hold circuits in the analog peripherals.

17.3.3. Clock Setting

The ADC clock is derived from FCLK and can be set with **ADCCTL.ADCCDIV**. The ADC clock should not exceed 16MHz for correct operation.

The EMUX clock is derived from HCLK and can be set with **EMUXCTL.EMUXCDIV**.

17.3.4. ADC

The ADC, ASC0, ASC1 and EMUX block is enabled with **ADCCTL.ADCEN**. In manual conversion mode set **ADCCTL.ADCMODE** to 0b. Set the ADx channel with **ADCCTL.ADCMUX**. For single conversion, set **ADCCTL.REPEAT** to 0b, for repeated conversion set **ADCCTL.REPEAT** to 1b. To start a conversion set **ADCCTL.ADCSTART** to 1b. The ADC will start sampling the analog input channel for 3 clock cycles and holds the analog value in it's internal S/H for conversion. It is safe to switch ADC input channel 4 clocks after ADC start without affecting the ADC result.

One complete ADC conversion will take 16 ADC clock cycles and the ADC conversion result will be available in **ADCCR**. In repeated mode **ADCCR** will be overwritten every 16 ADC clock cycles.. The **ADCCTL.ADCBUSY** flag will 1b as long as conversions are active. **ADCCTL.ADCSTART** will auto clear in single conversion mode. To stop a conversion manually clear **ADCCTL.ADCSTART**.

Figure 17-2. ADC Conversion (Single Shot)

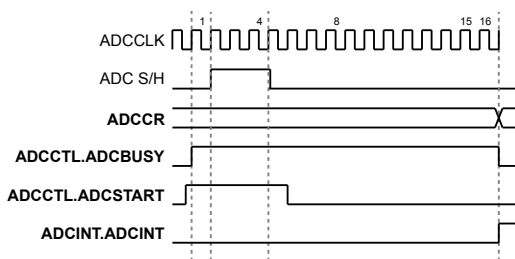

Figure 17-3. ADC Conversion (Repeat Mode)

17.3.5. EMUX

The EMUX is a low latency high speed serial interface with 8-bit data message to control the external ADC MUX and S/H in the analog front end. The EMUX interface is independent from the SOC BUS bridge.

The clock frequency of the EMUX can be adjusted with **EMUXCTL.EMUXCDIV** from HCLK/1 to HCLK/8.

To allow use of EMUX with auto sequencer ASC0 and ASC1, **EMUXCTL.EMUXC** must be set to 1b.

In manual mode with **EMUXCTL.EMUXC** = 0b, the EMUX will start sending the message MSB first as soon as a 8-bit message is written to **EMUXDATA**. While the message is transferred, **EMUXCTL.EMUXDONE** is cleared and is set to 1b when the message transfer is complete.

17.3.6. Auto Sequencer ASC0, ASC1

The ADC and EMUX can be controlled with 2 independent auto sequencer state machines ASC0 and ASC01 to

offload the CPU from high speed, low latency sampling. Each sequencer can be programmed to take up to 8 consecutive ADC samples from different analog inputs.

17.3.6.1. Auto Sequencer Modes

The AC0, ASC1 support 8 different modes, configurable with **ADCCTL.ADCMODE**.

With **ADCCTL.ADCMODE** = 000b ASC0 and ASC1 are disabled and the ADC is used in manual mode.

With **ADCCTL.ADCMODE** = 001b only ASC0 is active and manually triggered with **AS0CTL.AS0EN**.

With **ADCCTL.ADCMODE** = 010b only ASC1 is enabled and manually triggered with **AS1CTL.AS1EN**.

With **ADCCTL.ADCMODE** = 011b ASC0 and ASC1 are enabled and daisy chained. When manually triggered with **AS0CTL.AS0EN**. ASC0 will convert all programmed samples, when finished ASC0 will automatically trigger ASC1.

With **ADCCTL.ADCMODE** = 100b only ASC0 is active and triggered with trigger source configured in **AS0CTL.AS0TR**.

With **ADCCTL.ADCMODE** = 101b only ASC1 is active and triggered with trigger source configured in **AS1CTL.AS1TR**.

With **ADCCTL.ADCMODE** = 110b ASC0 and ASC1 are enabled and daisy chained. When triggered with source defined in **AS0CTL.AS0TR**, ASC0 will convert all programmed samples, when finished ASC0 will automatically trigger ASC1.

With **ADCCTL.ADCMODE** = 111b ASC0 and ASC1 are enabled and run independently. ASC0 is triggered with **AS0CTL.AS0TR**, ASC1 is triggered with **AS1CTL.AS1TR**.

Figure 17-4. ASCx, ADCCTL.ADCMODE = 001b, 010b, 100b, 101b

Figure 17-5. ASCx, ADCCTL.ADCMODE = 011b, 110b

Figure 17-6. ASCx, ADCCTL.ADCMODE = 111b

17.3.6.2. Sequencer trigger

Each sequencer ASC0 and ASC1 can use 2 different trigger modes, manual mode or automated mode.

In automated mode use **ASxCTL.ASxTR** to set the trigger source either to timer A, B, C, or D or PWMAx, PWMBx, PWMCx or PWMDx. Use **AS0xCTL.ASxTRE** to set rising or falling edge trigger. Use **AS0xCTL.ASxTMR** to select timer source or **AS0xCTL.ASxTRPWM** to PWM source.

17.3.6.3. ASC Samples

Each sequencer can be programmed to take 1 to 8 samples up on triggering using **ASxCTL.AsxD**. For each sample, the ADC channel can be programmed with **ASxSy.ADCMUX**, a delay between MUX change and ADC start using **ASxSy.DELAY**, a EMUX message to be send with **ASxSy.EMUXD**, and a configuration with **ASxSy.EMUXS** to not send EMUXD, send right after ADCMUX change or send right after start of delay.

NOTE:

Make sure that the EMUX transmission is finished within delay time or ADC conversion time by choosing the correct EMUX clock divider setting.

Figure 17-7. ASxSy Sample with ASxSy.EMUXS = 00b and ASxSy.DELAY = 11b

Figure 17-8. ASxSy Sample with ASxSy.EMUXS = 01b and ASxSy.DELAY = 11b

Figure 17-9. ASxSy Sample with ASxSy.EMUXS = 10b and ASxSy.DELAY = 11b

17.3.6.4. ASC0, ASC1 Priority and Collision

In **ADCCTL.ADCMODE** = 100b, 101b, 110b the ASC are triggered with external trigger timer or PWM. Care has to be taken to space the trigger wide enough to allow sequencer ASCx to finish all samples. In case the sequencer trigger event happens before ASC sequencer finishes all samples, the **ADCINT.ADCINT** collision interrupt will be set and the trigger will be ignored. When **ADCINT.ADCINT** is set, **ADCINT.ADCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ADCINTR** the actual running sequencer.

Figure 17-10. ASCx, 8 samples, No Collision

Figure 17-11. ASCx 8 samples, Collision

In **ADCCTL.ADCMODE = 111b**, the ASC0 and ASC1 sequencer are triggered independently but are accessing the same ADC.

In case of both ASC0 and ASC1 are triggered at the same time, ASC0 has always higher priority and will be executed while ASC1 is skipped and ignored. **ADCINT.ASCINT** will be set, **ADCINT.ASCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ASCINTR** the actual running sequencer.

In case of ASC0 or ASC1 sequencer running while the other is triggered, the second sequencer trigger is skipped and ignored, **ADCINT.ASCINT** will be set, **ADCINT.ASCINTSEQ** shows the ASC0 or ASC1 trigger causing the collision interrupt and **ADCINT.ASCINTR** the actual running sequencer.

Figure 17-12. ASC0 8 samples, ASC1 4 samples, Collision

18.2. Details of Operation

18.2.1. Block Diagram

Figure 18-1. I2C

18.2.2. Configuration

Following blocks need to be configured for correct use of the I2C:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

18.2.3. I2C

The I2C Controller has one master and one slave connected to the same I/O that can be configured to be master only, slave only or concurrent master/slave. The I2C controller supports Normal mode (100kHz), Fast mode (400kHz), and Fast Mode+ (1MHz) operation as well as either 7-bit or 10-bit addressing.

The master supports both single master and multi-master, multi-master sync and multi-master arbitration. The slave supports clock stretching as well.

18.2.4. I2C Clock setting

The I2C SCLK frequency is derived from HCLK, **I2CBAUD.SCLH** sets the SCLK high pulse and **I2CBAUD.SCLL** sets the SCLK low pulse in HCLK cycles and need to be set correctly for different I2C mode.

The minimum HCLK for correct function of the I2C block is: 2.8MHz for normal mode, 3.2MHz for fast mode and 6.14MHz for fast+ mode.

The table below shows pre-calculated **I2CBAUD** settings for normal, fast and fast+ mode with 50MHz HCLK.

Table 18-11. I2CBAUD settings for different HCLK

I2C Mode	SCLK Frequency	HLCK	I2CBAUD.SCLH	I2CBAUD.SCLL
Normal	100kHz	50MHz	0xFA	0xFA
Normal	100kHz	4MHz	0x14	0x14
Normal	100kHz	2.8MHz	0x0E	0x0E
Fast	400kHz	50MHz	0x3E	0x3E
Fast	400kHz	4MHz	0x3E	0x3E
Fast	400kHz	3.2MHz	0x04	0x04
Fast+	1000kHz	50MHz	0x18	0x18
Fast+	1000kHz	6.14MHz	0x03	0x03

18.2.5. I2C Addressing

The I2C address is for I2C master is set in **I2CMCTRL.I2CADDRL** and **I2CMCTRL.I2CADDRH**. The slave address is set **I2CADDR.SLADDRL** and **I2CADDR.SLADDRH**.

18.2.6. I2C Master Read Transactions

The diagram below shows an example of an I2C master read, including which interrupts occur for firmware processing of this transaction.

Figure 18-2. I2C Master Read Transaction

A Master Read is initiated when you write to the **I2CMTXDATA** and **I2CMCTRL** register. They need to be written in this order: **I2CMTXDATA** first, then **I2CMCTRL**.

- On the last byte of the transaction, write **MTXDAT** bit 0 to a zero. This tells the system to wait for an ACK from the slave.
- Write **I2CMCTRL** and set **XFERTYPE** to 1 (I2C Master Read), **RSTART** to the desired value (0: No STOP, 1: STOP) and the slave address in **I2CADDRU** and **I2CADDRL**.
- Once **I2CMCTRL** is written, the I2C transfer will begin.

The Master will send the first byte with the slave address and the Read command. The slave will ACK. Immediately after this first ACK, the master will request the first data byte.

When the first data byte is transferred into the Master, the Master will ACK and generate two interrupts: one for Master Transmit Data Register Empty and then one for Master Receive Data Register Full.

- Upon **I2CSTATUS.MTXE** interrupt (master transmit empty), the firmware must write a 1 to the **I2CMTXDATA.LBYTE** flag if there are more than one data byte pending to be received, or a 0 to the **I2CMTXDATA.LBYTE** if the next byte to be received is the last.
- Upon the **I2CSTATUS.MRXF** interrupt (master receive full), the firmware must read the **I2CMRXDATA** register.

Next, repeat until the N-1 data byte is received. On this byte, the firmware must write a 1 to the **I2CMTXDATA.LBYTE**. On the last byte received, the **I2CMTXDATA** must not be written. The **I2CMRXDATA** register still needs to be read.

The waveforms will be similar to the figure below.

PAC52xx Master Read Packet Structure

Figure 18-3. I2C Master Read Waveforms

1. First Data Byte **I2CSTATUS.MATXE** interrupt, **I2CMTXDATA.LBYTE = 0**
2. First Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
3. Second Data Byte **I2CSTATUS.MATXE** interrupt, **I2CMTXDATA.LBYTE = 1** (as byte #3 will be NACK'd)
4. Second Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
5. Third Data Byte **I2CSTATUS.MATXE** interrupt, do not write to the **I2CMTXDATA** register
6. Third Data Byte **I2CSTATUS.MRXF** interrupt, read the **I2CMTXDATA** register
7. **I2CMCTRL** Access Register Accessed – can be used for multi-packet communication management.
8. Master Transfer Complete – A STOP has been issued

19.1.6. UARTMCR

Register 19-5. UARTMCR (UART Modem Control, 0x401D 0010)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:5	Reserved	R	0x0	Reserved
4	LP	RW	0x0	Loopback 1b: loopback enabled 0b: loopback not enabled
2:0	Reserved	RW	0x0	Reserved

19.1.7. UARTLSR

Register 19-6. UARTLSR (UART Line Status, 0x401D 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7	RXE	R	0x0	RX FIFO Error 1b: at least 1 parity, framing or break error active in FIFO 0b: no error in RX FIFO
6	TXE	R	0x1	TX Empty 1b: TX shift register and TX FIFO are empty 0b: not empty

BIT	NAME	ACCESS	RESET	DESCRIPTION
5	TCFE	R	0x1	TX FIFO Empty 1b: TX FIFO are empty 0b: not empty
4	RXBE	R	0x0	RX Break 1b: entry on top of RX FIFO has break error, bit clears on read 0b: error cleared
3	RXFE	R	0x0	RX Framing Error 1b: entry on top of RX FIFO has framing error, bit clears on read 0b: error cleared
2	RXPE	R	0x0	RX Parity Error 1b: entry on top of RX FIFO has parity error, bit clears on read 0b: error cleared
1	RXOE	R	0x0	RX Overrun error 1b: RX FIFO full and last entry overwritten, bit clears on read 0b: error cleared
0	RXDR	R	0x0	RX Data ready 1b: at least 1 entry in RX FIFO 0b: RX FIFO empty

19.1.8. UARTSP

Register 19-7. UARTSP (UART Scratch Pad, 0x401D 001C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7:0	SP	RW	0x0	8b scratch pad

19.1.9. UARTFCTL2

Register 19-8. UARTFCTL2 (FIFO Control, 0x401D 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7:6	RXFT	RW	0x1	RX FIFO Threshold 11b: 14 Bytes in FIFO 10b: 8 Bytes in FIFO 01b: 4 Bytes in FIFO 00b: 1 Byte in FIFO
5:3	Reserved	R	0x0	Reserved
2	TXFRESET	RW	0x0	TX FIFO reset 1b: clear TX FIFO, bit auto clears 0b: no action
1	RXFRESET	RW	0x0	RX FIFO reset 1b: clear RX FIFO, bit auto clears 0b: no action
0	FEN	RW	0x0	FIFO enable 1b: enable RX, TX FIFO 0b: disable RX, TX FIFO

19.1.10. UARTIER2

Register 19-9. UARTIER2 (UART Interrupt Enable, 0x401D 0024)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:4	Reserved	R	0x0	Reserved
3	MSINTEN	RW	0x0	Modem Status interrupt enable 1b: enable interrupt 0b: disable interrupt
2	RSINTEN	RW	0x0	Receive interrupt enable 1b: enable interrupt 0b: disable interrupt
1	TXINTEN	RW	0x0	TX register empty interrupt enable 1b: enable interrupt 0b: disable interrupt
0	RXINTEN	RW	0x0	RX register data available interrupt enable 1b: enable interrupt 0b: disable interrupt

19.1.11. UARTDL_L2

Register 19-10. UARTDL_L2 (UART Divisor Latch Low Byte, 0x401D 0028)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7:0	DL_L	RW	0x0	Divisor value, low byte (does not need DLAP = 0 in order to work).

19.1.12. UARTDL_H2

Register 19-11. UARTDL_H2 (UART Divisor Latch High Byte, 0x401D 002C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7:0	DL_H	RW	0x0	Divisor value, high byte (does not need DLAP = 0 in order to work).

19.1.13. UARTFD_F

Register 19-12. UARTFD_F (UART Fractional Divisor Value, 0x401D 0038)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:8	Reserved	R	0x0	Reserved
7:0	FRAC	RW	0x0	Fractional divisor value

19.1.14. UARTSTAT

Register 19-13. UARTSTAT (UART FIFO Status, 0x401D 0040)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:4	Reserved	R	0x0	Reserved
3	RXFF	R	0x0	RX FIFO full 1b: RX FIFO full 0b: RX FIFO not full
2	RXFE	R	0x1	RX FIFO empty 1b: RX FIFO empty 0b: RX FIFO not empty
1	TXFF	R	0x0	TX FIFO full 1b: TX FIFO full 0b: TX FIFO not full
0	TXFE	R	0x1	TX FIFO empty 1b: TX FIFO empty 0b: TX FIFO not empty

19.2. Details of Operation

19.2.1. Block Diagram

Figure 19-1. UART

19.2.2. Configuration

Following blocks need to be configured for correct use of the UART:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- I/O Controller

19.2.3. UART

The UART supports up to 3.125 Mbps communication speed, has programmable clock selection with fractional divider, loop back mode for testing, 16 Byte transmit and 16 Byte receive FIFO with programmable receive interrupt threshold.

19.2.4. UART Clock Rate Setting

The UART block has a fractional divider to set up the baud rate. The UART clock is fed by the HCLK. The UART clock must be set to 16x the desired RX TX baud rate setting for correct functioning.

To calculate settings for **UARTDL_H**, **UARTDL_L**, **UARTFD_F**, first calculate the desired divider setting using following formula:

$$UARTDivisor = \frac{HCLK}{BAUDRATE * 16} \quad (6)$$

Where:

UARTDivisor: calculated divisor

HCLK: HCLK frequency in Hz

BAUDRATE: desired Baud rate

The integer portion of UARTDivisor is used to set **UARTDL_H**, **UARTDL_L**.

To calculate the value of **UARTFD_F**, use formula below and round to the nearest integer.

$$UARTFD = UARTDivisor_{frac} * 256 \quad (7)$$

Where:

UARTFD: calculated UARTFD value

UARTDIVISOR_FRAC: UARTDivisor fractional value

To calculate Baud rate error use following:

$$BAUDRATEERROR = BAUDRATE - (HCLK / (UARTDivisor + UARTDivisor_{frac} / 256)) / 16 \quad (8)$$

Where:

BAUDRATEERROR: absolute baud rate error

BAUDRATE: Baudrate

HCLK: HCLK frequency in Hz

UARTDivisor: UART divisor integer value

UARTDivisor_frac: UART divisor fractional value

To calculate relative Baud rate error use following:

$$Relative\ BAUDRATEERROR = BAUDRATEERROR / BAUDRATE * 100 \quad (9)$$

Where:

Relative BAUDRATE ERROR: relative BAUD rate error in %.

BAUDRATEERROR: absolute Baudrateerror

BAUDRATE: desired baudrate setting

The table below shows pre-calculated divisor settings for common Baud rates with 50MHz HCLK.

Register 19-14. UART Divisor Settings for 50 MHz HCLK

Baud Rate	Desired Divisor	Int	frac	UARTDL_H	UARTDL_L	UARTFD_F	Absolute BAUD rate error	BAUD rate error %
300	10416.667	10416	171	0x28	0xB0	0xAB	0.000010	0.0000%

38400	81.380	81	97	0x00	0x51	0x61	-0.1	-0.0003%
57600	54.253	54	65	0x00	0x41	0x41	-0.501355	-0.0009%
115200	27.127	27	33	0x00	0x21	0x21	1.120655	0.0010%

19.2.5. Data settings

The **UARTLCR** register defines the character settings like number of data bits, parity and number of stop bits

19.2.6. FIFO Settings

The FIFO can be configured with the **UARTFCTL** register. FIFO enable, depth and TX/RX FIFO reset can be configured. The FIFO status can be monitored in the **UARTLSR** register. A write to **UARTRTX** writes to the TX FIFO, while a read from **UARTRTX** reads from RX FIFO.

19.2.7. Error Checking on Received Data

The character specific error does not show up in **UARTLSR** until the character is at the top of the RX FIFO.

Each captured character is checked for following errors

- Break Error **UARTLSR.RXBE** – there was a logic '0' detected on the RX input for more than one character transmission period ($BAUD\ RATE * (1\ startbit + UARTLCR.BPC\ data\ bits + 1\ parity\ bit + UARTLCR.STB\ stopbits)$)
- Framing Error **UARTLSR.RXFE** – there was a logic '0' detected where there should be a STOP bit
- Parity Error **UARTLSR.PE** – received parity and calculated parity do not match.

20. SOC BUS BRIDGE

20.1. Register

20.1.1. Register Map

Table 20-1. SOC Bus Bridge Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE

4	Reserved	RW	0x0	Reserved, be set to 0x0
3	Reserved	RW	0x0	Reserved, mbe set to 0x0
2	MRST	RW	0x0	Module reset. 1b: Force soft reset of module. The internal state machines are reset; Status register is cleared; However, the soft reset doesn't affect control register values. 0b: do not hold the module in reset.
1:0	Reserved	RW	0x0	Reserved, set to 0x0

20.1.4. SOCBCLKDIV

Register 20-3. SOCBCLK (SOC Bus Bridge Clock Divider, 0x4020 0008)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:16	Reserved	R	0x0	Reserved
15:0	CLKDIV	RW	0x8	Clock divisor for SCLK: $SCLK = HCLK / [(CLKDIV+1)*2]$ the minimum divider is /2

20.1.5. SOCBSTAT

Register 20-4. SOCBSTAT (SOC Bus Bridge Status, 0x4020 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:15	Reserved	R	0x0	Reserved
14:12	CURSTATE	RW	0x0	Raw status of the SOC bus bridge master state machine's "current_state" register. 111b: CSBEGIN 110b: MTRANS 101b: CKWAIT 100b: CSWAIT 011b: CSHOLD 010b: TRANSFER 001b: CSSETUP 000b: IDLE
11	Reserved	R	0x0	Reserved
10	RXFULL	R	0x0	Raw indicator that the Rx incoming holding register contains a valid data word. 1b: Rx incoming holding register contains a valid data word. 0b: Rx incoming holding register contains no valid data word.
9	TXFULL	R	0x0	Raw indicator that the Tx outgoing holding register is still in use, and not ready to accept another data word. 1b: Tx outgoing holding register is still in use not ready to accept another data word. 0b: Tx outgoing register is ready to accept another data word

BIT	NAME	ACCESS	RESET	DESCRIPTION
8	WRUFL	RW	0x0	Write Buffer Underflow: set on the start of a second outgoing transfer if data hasn't been written to the SOCBD after the previous transfer 1b: Write Underflow detected, clear by writing 1b to it 0b: No Write Underflow since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.WRUFL_EN .
7:6	Reserved	RW	0x0	Reserved, must be set to 0x0
5	CYC_DONE	RW	0x0	Cycle Done: this bit will set when the current transfer of 8 bits is complete. It indicates that 8 bits were sent on the transmit port and 8 bits were sampled on the receive port. 1b: Cycle done detected, clear by writing 1b to it 0b: No Cycle Done detected since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.CYC_DONE_EN .
4:3	Reserved	RW	0x0	Reserved, must be set to 0x0
2	RDOFL	RW	0x0	Read Buffer Overflow: set on the completion of a second incoming transfer if data hasn't been read from the SOCBD from the previous transfer 1b: Read Overflow detected, clear by writing 1b to it 0b: No Read Overflow since this bit was cleared Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SOCBINT_EN.RDOFL_EN .
1	Reserved	R	0x0	Reserved
0	SOCB_INT	R	0x0	SOC bus bridge Interrupt Logical OR of each raw status bit WRUFL, RDOFL, and CYC_DONE, qualified with its corresponding SOCBINT_EN enable. 1b: interrupt 0b: no interrupt Note that if the corresponding SOCBINT_EN of those status bits is reset to '0', those status bits themselves will still assert upon meeting the condition, but will not contribute to the assertion of SOCB_INT. The status bits are true "raw" status bits, and the corresponding SOCBINT_EN simply allows them to cause an interrupt.

20.1.6. SOCBCSSTR

Register 20-5. SOCBSTAT (SOC Bus Bridge Chip Select Steering, 0x4020 0018)

BIT	NAME	ACCESS	RESET	DESCRIPTION

20.1.8. SOCBINT_EN

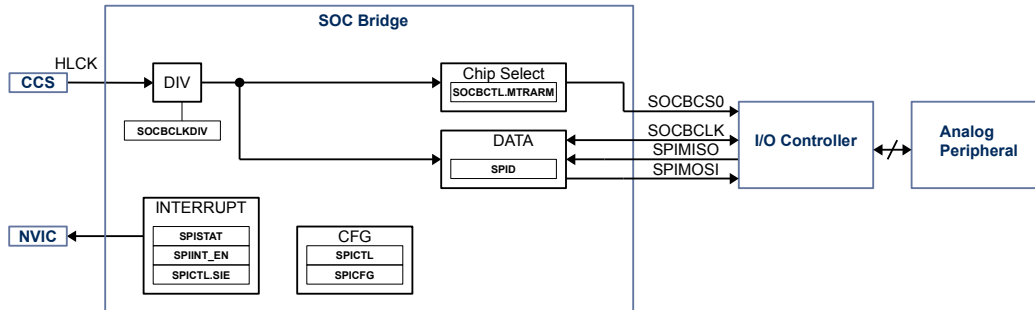

Register 20-7. SOCBINT_EN (SOC Bus Bridge Interrupt Enable, 0x4020 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:9	Reserved	RW	0x0	Reserved
8	WRUFL_EN	RW	0x0	Write buffer underflow WRUFL interrupt enable 1b: enable SOCBSTAT.WRUFL interrupt 0b: disable SOCBSTAT.WRUFL interrupt
7:6	Reserved	RW	0x0	Reserved, set to 0x0
5	CYC_DONE	RW	0x1	Cycle done interrupt enable 1b: enable SOCBSTAT.CYC_DONE interrupt 0b: disable SOCBSTAT.CYC_DONE interrupt
4:3	Reserved	RW	0x1	Reserved, set to 0x0
2	RDOFL_EN	RW	0x1	Read buffer overflow RDOFL interrupt enable 1b: enable SOCBSTAT.RDOFL interrupt 0b: disable SOCBSTAT.RDOFL interrupt
1:0	Reserved	RW	0x0	Reserved

20.2. Details of Operation

20.2.1. Block Diagram

Figure 20-1. SOC Bridge

20.2.2. Configuration

Following blocks need to be configured for correct use of the SPI:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

20.2.3. SOC Bridge

The SOC bridge is used to set and read registers in the analog section of the device.

20.2.4. SOC Bridge Clock Rate Setting

The SOC bridge Module SOCCLK is derived from HCLK to drive the SPI logic, generate setup, hold and wait timings for CSx signals, and SOCCLK.

The SPICLK clock is derived from HCLK using a clock divider configurable with **SOBCLKDIV**. The lowest clock allowable divider in SPI slave mode is HCLK/8. In SPI Master mode the lowest allowable clock divider is HCLK/2.

To calculate SOCCLK use

$$SOCCLK = \frac{HLCK}{(SOBCLKDIV + 1) * 2} \quad (10)$$

Where:

SOCCLK: SOCCLK in Hz

HCLK: HLCK in Hz

SOBCLKDIV: **SOBCLKDIV** setting

20.2.5. Enable and Setup of SOC Bridge

20.2.6. SOC Interrupt

The SOC bridge engine interrupt is enabled with **SOCBCTL.SIE**. Then any sub interrupts are enabled in **SINT_EN**.

20.2.7. SOC Bridge Protocol

The SOC bridge protocol is a 2 byte protocol, the first byte is the address packet including a 7-bit address [7:1] and a write bit [0], the second packet is an 8bit data packet.

20.2.8. Reading from SOC Bridge

To read to the SOC bridge, start with writing the address packet to **SOCBD** first. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Then write a second dummy address packet to **SOCBD** to clock out the data packet. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Set **SOCBCTL.MTRARM** to 1b to deassert SOCBCS0. Then read from **SOCBD** to get the data packet content

Figure 20-2. Single Read from SOC Bridge

20.2.9. Writing to SOC Bridge

To write to the SOC bridge, start with writing the address packet to **SOCBD** first. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Then write the data packet to **SOCBD**. Wait for **SOCBSTAT.CYC_DONE** = 1b. Clear **SOCBSTAT.CYC_DONE** by set to 1b. Set **SOCBCTL.MTRARM** to 1b to deassert SOCBCS0. Optional you read from **SOCBD** to get the data packet content with old data content of the register address.

Figure 20-3. Single Write to SOC Bridge

3	LB1ST	RW	0x0	Least Bit First 1b: LSB is the first serial bit of a transfer 0b: MSB is the first serial bit of a transfer

BIT	NAME	ACCESS	RESET	DESCRIPTION
2	MRST	RW	0x0	Module reset. 1b: Force soft reset of module. The internal state machines are reset; Status register is cleared; However, the soft reset doesn't affect control register values. 0b: do not hold the module in reset.
1:0	WL	RW	0x0	Word Length select 11b: Word Length = 32-bits 10b: Word Length = 24-bits 01b: Word Length = 16-bits 00b: Word Length = 8-bits

21.1.4. SPICLKDIV

Register 21-3. SPICLKDIV (SPI Clock Divider, 0x4021 0008)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:16	Reserved	R	0x0	Reserved
15:0	CLKDIV	RW	0x8	Clock divisor for SCLK: $SCLK = HCLK / [(CLKDIV+1)*2]$ In Master/Slave mode with SPICFG.MTURBO = 0b, minimum divider is /8. In Master mode with SPICFG.MTURBO = 1b, minimum divider is /2

21.1.5. SPISTAT

Register 21-4. SPISTAT (SPI Status, 0x4021 0014)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:15	Reserved	R	0x0	Reserved
14:12	CURSTATE	RW	0x0	Raw status of the SOC bus bridge master state machine's "current_state" register. 111b: CSBEGIN 110b: MTRANS 101b: CKWAIT 100b: CSWAIT 011b: CSHOLD 010b: TRANSFER 001b: CSSETUP 000b: IDLE
11	Reserved	R	0x0	Reserved
10	RXFULL	R	0x0	Raw indicator that the Rx incoming holding register contains a valid data word. 1b: Rx incoming holding register contains a valid data word. 0b: Rx incoming holding register contains no valid data word.
9	TXFULL	R	0x0	Raw indicator that the Tx outgoing holding register is still in use, and not ready to accept another data word. 1b: Tx outgoing holding register is still in use not ready to accept another data word. 0b: Tx outgoing register is ready to accept another data word

BIT	NAME	ACCESS	RESET	DESCRIPTION
8	WRUFL	RW	0x0	<p>Write Buffer Underflow</p> <p>Set on the start of a second outgoing transfer if data hasn't been written to the SD register after the previous transfer</p> <p>1b: Write Underflow detected, clear by writing 1b to it</p> <p>0b: No Write Underflow since this bit was cleared</p> <p>Note: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.WRUFL_EN.</p>
7	Reserved	RW	0x0	Reserved, must be set to 0x0
6	TE	RW	0x0	<p>Chip Select Trailing Edge Detect</p> <p>1b: a chip select de-assertion was detected, clear by writing 1b to it</p> <p>0b: no chip select de-assertion detected since this bit was cleared</p> <p>NOTE: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.TE_EN.</p>
5	CYC_DONE	RW	0x0	<p>Cycle Done: this bit will set when the current transfer of 8 bits is complete. It indicates that 8 bits were sent on the transmit port and 8 bits were sampled on the receive port.</p> <p>1b: Cycle done detected, clear by writing 1b to it</p> <p>0b: No Cycle Done detected since this bit was cleared</p> <p>NOTE: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.CYC_DONE_EN.</p>
4	UCLK	RW	0x0	<p>Underclock Condition</p> <p>Set if the current transfer received less than word-length "WL" clocks on the SPICLK line prior to CSx de-assertion.</p> <p>1b: Underclock condition detected, clear by writing 1b to it</p> <p>0b: No underclock condition detected since this bit was cleared.</p> <p>NOTE: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.UCLK_EN.</p>
3	LE	RW	0x0	<p>Chip Select Leading Edge Detect:</p> <p>1b: a chip select assertion was detected, clear by writing 1 to it</p> <p>0b: no chip select assertion detected since this bit was cleared</p> <p>NOTE: This bit is cleared by writing a 1b to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.LE_EN.</p>
2	RDOFL	RW	0x0	<p>Read Buffer Overflow: set on the completion of a second incoming transfer if data hasn't been read from the SD register from the previous transfer</p> <p>1b: Read Overflow detected, clear by writing 1b to it</p> <p>0b: No Read Overflow since this bit was cleared</p> <p>NOTE: This bit is cleared by writing a '1' to it. This bit is a sticky status bit, and will set upon meeting the condition regardless of the state of its corresponding interrupt enable SPIINT_EN.RDOFL_EN.</p>
1	Reserved	R	0x0	Reserved

BIT	NAME	ACCESS	RESET	DESCRIPTION
0	SPI_INT	R	0x0	SPI Interrupt Logical OR of each raw status bit WRUFL, RDOFL, and CYC_DONE, qualified with its corresponding INT_EN enable. 1b: interrupt 0b: no interrupt NOTE: that if the corresponding INT_EN of those status bits is reset to '0', those status bits themselves will still assert upon meeting the condition, but will not contribute to the assertion of SPI_INT. The status bits are true "raw" status bits, and the corresponding SPIINT_EN simply allows them to cause an interrupt.

21.1.6. SPICSSTR

Register 21-5. SPICSSTR (SPI Chip Select Steering, 0x4021 0018)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:24	Reserved	RW	0x0	Reserved
23:20	CKWAIT	RW	0x0	SPI Clock Wait (MASTER mode only): Only applies if SPICTL.MTRANS=1b (multiple transfers with one chip select assertion). This value determines the minimum number of SPICLK periods to wait between back-to-back transfers. During this wait time, SPICLK does not toggle but CSx remains active.
19:16	CSWAIT	RW	0x0	Chip Select Wait (MASTER mode only): This value determines the minimum number of SPICLK periods to wait between the de-assertion of CSx and the re-assertion of Csx.
15:12	CSHOLD	RW	0x0	Chip Select Hold (MASTER mode only): This value is the minimum number of SPICLK periods to wait from the last SPICLK transition to de-assertion of Csx.
11:8	CSSETUP	RW	0x0	Chip Select Setup (MASTER mode only): This value is the minimum number of SPICLK periods to wait from the assertion of CSx to the first SPICLK transition.
7:3	Reserved	R	0x0	Reserved
2	CSL	RW	0x0	Chip Select active level select (MASTER or SLAVE mode): 1b: active HI outgoing (master) or incoming (slave) chip select 0b: active LO outgoing (master) or incoming (slave) chip select
1:0	CSNUM	RW	0x0	Chip Select Number: Outgoing (MASTER mode) - select which one of the possible four chip selects are asserted (the other three are driven de-asserted). Incoming (SLAVE mode) – select which one of the possible four chip selects are actively used. 11b: reserved 10b: SPICS2 01b: SPICS1 00b: SPICS0

21.1.7. SPID

Register 21-6. SPID (SPI Data, 0x4021 001C)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:0	DATA	RW	0x0	SOC bus bridge data On READ: retrieve received data word from the incoming holding buffer. On WRITE: write a data word to the outgoing holding buffer.

21.1.8. SPIINT_EN

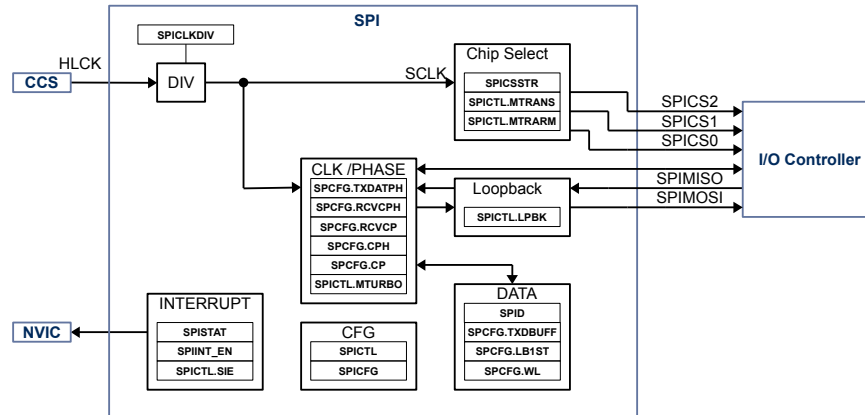

Register 21-7. SPIINT_EN (SPI Interrupt Enable, 0x4021 0020)

BIT	NAME	ACCESS	RESET	DESCRIPTION
31:9	Reserved	RW	0x0	Reserved
8	WRUFL_EN	RW	0x0	Write buffer underflow WRUFL interrupt enable 1b: enable SPISTAT.WRUFL interrupt 0b: disable SPISTAT.WRUFL interrupt
7	Reserved	RW	0x0	Reserved
6	TE_EN	RW	0x0	Trailing Edge detect TE interrupt enable 1b: enable SPISTAT.TE interrupt 0b: disable SPISTAT.TE interrupt
5	CYC_DONE_EN	RW	0x0	Cycle done CYC_DONE interrupt enable 1b: enable SPISTAT.CYC_DONE interrupt 0b: disable SPISTAT.CYC_DONE interrupt
4	UCLK_EN	RW	0x1	Underclock condition detect UCLK interrupt enable 1b: enable SPISTAT.UCLK interrupt 0b: disable SPISTAT.UCLK interrupt
3	LE_EN	RW	0x0	Leading Edge detect LE interrupt enable 1b: enable SPISTAT.LE interrupt 0b: disable SPISTAT.LE interrupt
2	RDOFL_EN	RW	0x1	Read buffer overflow RDOFL interrupt enable 1b: enable SPISTAT.RDOFL interrupt 0b: disable SPISTAT.RDOFL interrupt
1:0	Reserved	RW	0x0	Reserved

21.2. Details of Operation

21.2.1. Block Diagram

Figure 21-1. SPI

21.2.2. Configuration

Following blocks need to be configured for correct use of the SPI:

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller

21.2.3. SPI

The SPI engine has selectable data byte ordering LSB or MSB first, 4 different data / clock modes, can send / receive packets 8, 16, 32, 64 boundaries, selectable CS polarity, soft reset, and auto-retransmit.

In master mode it supports up to 3 different slaves using chip select. The master mode also allows sending multiple packets per CS.

21.2.4. SPI Clock Rate Setting

The SPI Module SPICLK is derived from HCLK to drive the SPI logic, generate setup, hold and wait timings for CSx signals, and SPICLK.

The SPICLK clock is derived from HCLK using a clock divider configurable with **SPICLKDIV**. The lowest clock allowable divider in SPI slave mode is HCLK/8. In SPI Master mode the lowest allowable clock divider is HCLK/2 if **SPICFG.MTURBO** is 1b, HCLK/8 if **SPICFG.MTURBO** is 0b. **SPICFG.MTURBO** works only in Master mode.

To calculate SCLK use

$$SCLK = \frac{HCLK}{(SPICLKDIV + 1) * 2} \quad (11)$$

Where:

SCLK: SCLK in Hz

HCLK: HLCK in Hz

SPICLKDIV: **SPICLKDIV** setting

21.2.5. Master Slave Mode

The master mode is selected with **SPICTL.SE**= 0b. In master mode a write to **SPID** will initiate SPI data transfer.

When **SPICFG.TXDBUF** is set to 1b, the **SPID** is double buffering is enabled, allowing queuing of the next data word while the current one is transferred.

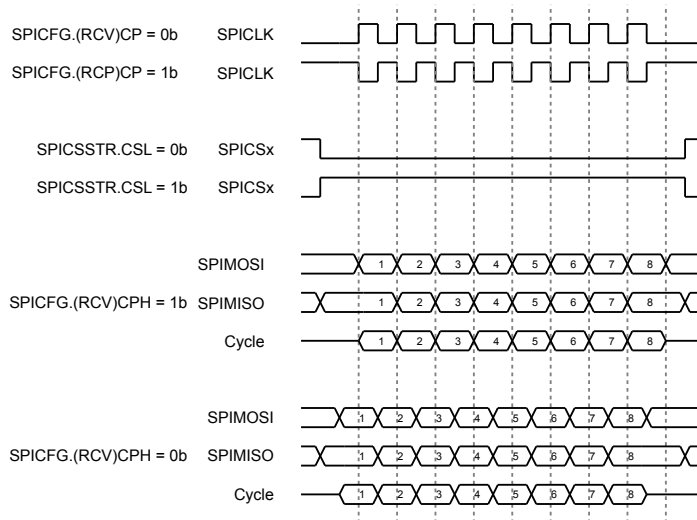

21.2.6. Clock Phase, Polarity

The clock and phase can be programmed independently for master and slave.

The master mode clock polarity is configured with **SPICFG.CP** and the phase is configured with **SPCFG.CPH**.

The slave mode clock polarity is configured with **SPICFG.RCVCP** and the phase is configured with **SPICFG.RCVCPH**.

Figure 21-2. SPI clock polarity and phase

21.2.7. SPI Early Data Transmit

For cases when the SPI is running at high speed the transmitted data can be transmitted 1/2 a **SPICLK** early to compensate for delays on the receiver side. When **SPICFG.TXDATPH** is 1b, **SPIMOSI** is transmitted 1/2 **SPICLK** early in master mode. In slave mode **SPIMISO** is transmitted 1/2 **SPICLK** early.

Figure 21-3. SPIMOSI early transmit in master mode

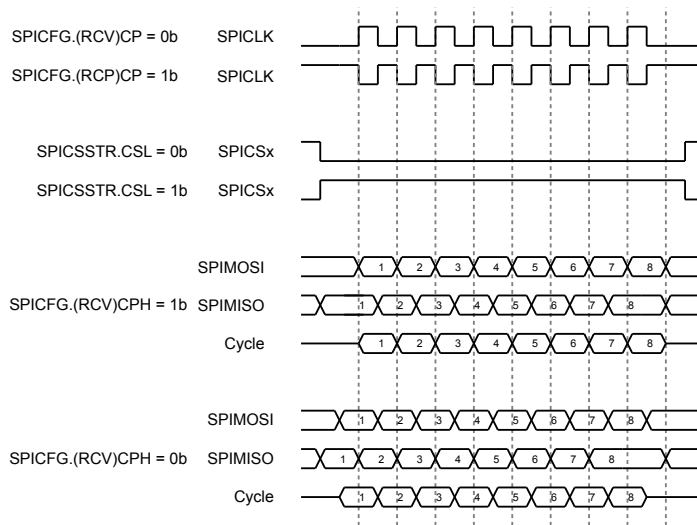

Figure 21-4. SPIMISO early transmit in slave mode

21.2.8. Data Format

The **SPICFG.WL** sets the word length from 8bit to 32bit in 8bit steps.

The **SPICFG.LB1ST** configures the data format to transmit, LSB ior MSB first.

21.2.9. Chip Select Settings

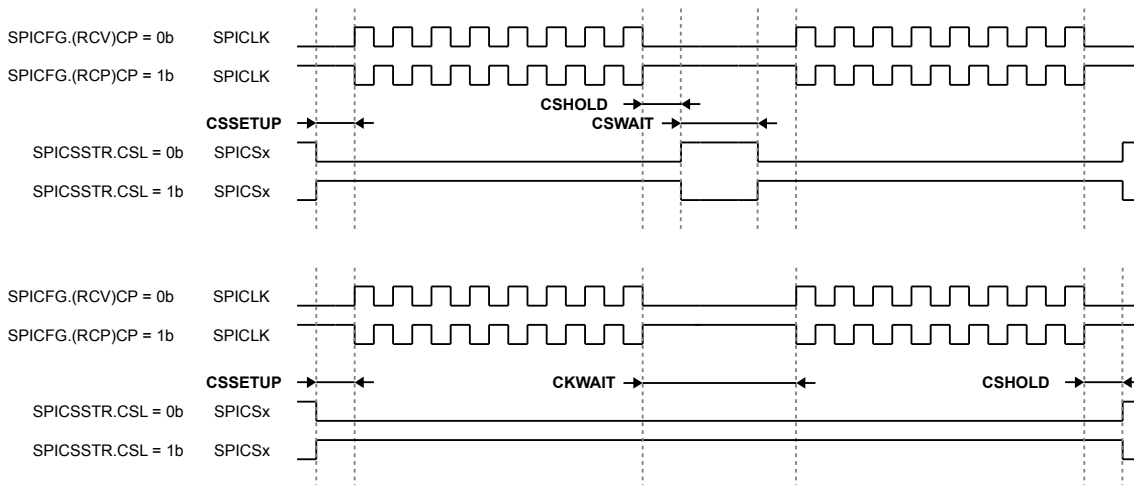

The SPI engine supports up to 3 chip select signals SPICS0, SPICS1 and SPICS2, selectable with **SPICSSTR.CSNUM**.

The CS polarity can be set with **SPICSSTR.CSL**, 0b for active low, 1b for active high.

In SPI engine can automatically assert and deassert SPICSx with each data transaction with **SPICTL.MTRANS** = 0b. To allow multiple data words within a SPICSx assertion set **SPICTL.MTRANS** to 1b. The first data word will assert SPICSx. SPICSx will remain low until it is deasserted with writing **SPICTL.MTARM** to 1b.

Timings for CS behavior can be programmed with granularity of SPICLK. The period between assertion of SPICSx and SPICLK transition can be set with **SPICSSTR.CSSETUP**. The period between last SPICLK transition and deassertion of SPICSx can be set with **SPICSSTR.CSHOLD**. The period between deassertion and assertion of SPICSx can be set with **SPICSSTR.CSWAIT**. The period between SPICLK transitions between multi word packages can be set with **SPICSSTR.CKWAIT**.

Figure 21-5. SPICSx

21.2.10. Auto Retransmit Data Word

Upon detection of an undercount **SPICSTAT.UCLK** error, the default behavior of the SPI module is to reset the SERDES bit counters and the transmit side holding buffers, assuming that software must re-load the word that did not complete transmission because of the UCLK error.

Note that the receive side holding buffers are **not** reset, and contain the data word received from the last **good** transfer.

An optional mode is provided by setting the RTRANS bit in the **SPICTL.RTRANS**. When set, the reset of the transmit side holding buffers because of UCLK error is disabled, and the word that did not complete transmission remains queued for transmit.

21.2.11. Loop Back Mode

The SPI engine has a loop back mode for test purposes, enabled with **SPICTL.LPBK**. The loop back mode is only available in master mode. In loop back mode, SPIMOSI and SPIMISO are connected together internally

and SPICLK, SPIMOSI, SPCSx can be still observed on pins.

21.2.12. SPI Interrupt

The SPI engine interrupt is enabled with **SPICTL.SIE**. Then any sub interrupts are enabled in **SPIINT_EN**.

21.2.13. SPI Enable

The SPI engine is enabled with **SPICTL.SSEN**. To soft reset the state machine and clear all status bits use **SPICFG.MRST**.

22. MULTI-MODE POWER MANAGER

22.1. Register

22.1.1. Register Map

Table 22-1. Multi-Mode Power Manager Register Map

ADDRESS	NAME	DESCRIPTION	RESET VALUE
Multi-Mode Power Manager			
0x00	SYSSTAT	System status	0x00
0x08	DEVID	Device identification	-
0x09	VERID	Version identification	-
0x10	PWRCTL	Power manager control	0x00
0x11	PWRSTAT	Power manager status	-
0x12	PSTATSET	Power manager setting	0x00
0x13	IMOD	Current modulation	0xFF
0x14	SCFG	Switching supply configuration	0x00
0x15	SCFG2	Switching supply configuration 2	0x00

22.1.2. SYSSTAT

Register 22-1. SYSSTAT (System Status, 0x00)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	PBSTAT	R/W	0x0	Push button status. When not masked, bit set on interrupt and cleared when written to 1b. When masked, bit is transparent.
6	TMPWARN	R	0x0	Temperature warning to indicate the temperature is over 140°C. When TMPWARN is not masked, this bit is latch when temperature is out of valid range and cleared when bit is read. When masked, bit is transparent.
5:4	VTHREF	R/W	0x0	Programmable threshold voltage. Used for AMP6 through AMP9 in comparator mode. 00b: 0.1V 01b: 0.2V 10b: 0.5V 11b: 1.25V
3	REFBP	R/W	0x0	Set external reference bypass via AB5.
2	Reserved	R/W	0x0	
1	FLTM	R/W	0x0	Fault mask (active high). Set to 1b to mask temperature fault. 0b: not masked 1b: masked
0	nINTM	R/W	0x0	Interrupt mask (active low) 0b: masked 1b: not masked

22.1.3. DEVID

Register 22-2. DEVID (Device Identification, 0x08)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:0	DEVID	R	-	Device identification

22.1.4. VERID

Register 22-3. VERID (Version Identification, 0x09)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:0	VERID	R	-	Version identification

22.1.5. PWRCTL

Register 22-4. PWRCTL (Power Manager Control, 0x10)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	HIB	R/W	0x0	Hibernate mode. This bit is cleared and power up sequence is initiated after the wake up timer delay or external event. 0b: normal 1b: shutdown mode
6	MCUALIVE	R/W	0x0	Micro-controller alive flag. Bit that MCU can set in the Power Manager to indicate that it has already initialized itself. Can be used by MCU to detect that it has been reset by the AFE. The convention is for the MCU to write this bit to 1b on initialization of the AFE, and test that it is not 1 during start-up.
5:3	PWRMON	R/W	0x0	Power monitor select. Selects the voltage signal for power monitoring at A/D converter input selector. 000b: V _{CC18} 001b: V _{CC33} scaled by 4/10 010b: V _{CCIO} scaled by 4/10 011b: V _{SYS} scaled by 4/10 100b: V _{REGO} scaled by 1/10 101b: V _P scaled by 1/10 110b: V _{HIM} scaled by 1/30 111b: V _{COMP} internal error amplifier output
2:0	WUTIMER	R/W	0x0	Wake-up timer delay 000b: infinite 001b: 125ms 010b: 250ms 011b: 500ms 100b: 1s 101b: 2s 110b: 4s 111b: 8s

22.1.6. PWRSTAT

Register 22-5. PWRSTAT (Power Manager Status, 0x11h, Persistent In Hibernate Mode)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	HWRSTAT	R	-	Hardware reset status. When not masked, bit is set on Hardware Reset and cleared when written to 1b.
6	WDTRSTAT	R	-	Watchdog timer reset status. When enabled, it is set on Watchdog Timer Reset and cleared when written to 1b.
5	MMSSFLT	R	-	Multi-mode switching supply fault status. Bit set on fault and cleared when written to 1b.
4	TMPFLT	R	-	Temperature fault status. Bit set on fault and cleared when written to 1b.
3	VSYSFLT	R	-	V _{SYS} fault status. Bit set on fault and cleared when written to 1b.
2	VCCIOFLT	R	-	V _{CCIO} fault status. Bit set on fault and cleared when written to 1b.
1	VCC33FLT	R	-	V _{CC33} fault status. Bit set on fault and cleared when written to 1b.
0	VCC18FLT	R	-	V _{CC18} fault status. Bit set on fault and cleared when written to 1b.

22.1.7. PSTATSET

Register 22-6. PSTATSET (Power Manager Setting, 0x12)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	UNLOCK	R/W	0x0	Software unlock. Write to 1b to enable writing to SCFG . 0b: SCFG locked 1b: SCFG unlocked
6	SU	R/W	0x0	Start-up. This bit is set to 0b when the device is powered up and may be written by the MCU to 1b at any time. This bit will retain its value as long as power to VHM is applied. After reset, the MCU can read this bit to tell if the MCU has been forcibly reset (if the value is still a 1b) or if it is a power-up reset (the value will be reset to 0b).
5	VPLOW	R/W1C	0x0	V _p low status. When not masked, bit set on interrupt and cleared when written to 1b.
4	nPBINTM	R/W	0x0	Push button interrupt mask (active low) 0b: masked 1b: not masked
3	nVPINTM	R/W	0x0	V _p low interrupt mask (active low) 0b: mask 1b: not masked
2	TWD	R/W	0x0	Watchdog timer delay 0b: 8s 1b: 4s
1	WDTEN	R/W	0x0	Watchdog timer enable 0b: disabled 1b: enabled
0	PBEN	R/W	0x0	Push button enable 0b: disabled 1b: enabled

22.1.8. IMOD

Register 22-7. IMOD (Current Modulation, 0x13)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:0	IMOD	R/W	0x00	Current modulation. 0xFF (default) = 100%. Inductor current is clamped to $IL_{MAX} \cdot (IMOD_{<7:0>} - 0x20) / FFh$. Power factor control can be achieved by modulating $(IMOD_{<7:0>} - 0x20 - VSLOPE_ERROR)$ to be proportional to the input voltage, multiplied by the feedback error factor derived in servo loop with the low-pass-filtered output voltage.

22.1.9. SCFG

Register 22-8. SCFG (Switching Supply Configuration, 0x14)

BIT	NAME	ACCESS ⁽¹⁾	RESET	DESCRIPTION																		
7	SRST	R/W	0x0	Soft reset. Write to 1b to assert nRST and generate system soft reset. 0b: normal 1b: reset

23.1.17. SOC.ADCIN1

Register 23-16. SOC.ADCIN1 (AD Mux Selector, SOC 0x2F)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:4	Reserved	R/W	0x0	Reserved, write to 0x0
3:0	MUXA	R/W	0x0	AD Mux Channel Selector 1111b: VREF / 2 1110b: AB12 1101b: AB11 1100b: AB10 1011b: AB9 1010b: AB8 1001b: AB7 1000b: AB6 0111b: AB5 0110b: AB4 0101b: AB3 0100b: AB2 0011b: AB1 0010b: DAO54 0001b: DAO32 0000b: DAO10

23.1.18. SOC.PROTINTM

Register 23-17. SOC.PROTINTM (Protection Interrupt Enable, SOC 0x30)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	Reserved	R/W	0x0	Reserved, write to 0x0
6	HP54INTEN	R/W	0x0	HPROT54 Interrupt enable 1b: enable 0b: disabled
5	HP32INTEN	R/W	0x0	HPROT32 Interrupt enable 1b: enable 0b: disabled
4	HP10INTEN	R/W	0x0	HPROT10 Interrupt enable 1b: enable 0b: disabled
3	Reserved	R/W	0x0	Reserved, write to 0x0
2	LP54INTEN	R/W	0x0	LPROT54 Interrupt enable 1b: enable 0b: disabled
1	LP32INTEN	R/W	0x0	LPROT32 Interrupt enable 1b: enable 0b: disabled
0	LP10INTEN	R/W	0x0	LPROT10 Interrupt enable 1b: enable 0b: disabled

23.1.19. SOC.PROTSTAT

Register 23-18. SOC.PROTSTAT (Protection Interrupt, SOC 0x31)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	Reserved	R/W	0x0	Reserved, write to 0x0
6	HP54INT	R/W	0x0	HPROT54 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt
5	HP32INT	R/W	0x0	HPROT32 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt
4	HP10INT	R/W	0x0	HPROT10 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt
3	Reserved	R/W	0x0	Reserved, write to 0x0
2	LP54INT	R/W	0x0	LPROT54 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt
1	LP32INT	R/W	0x0	LPROT32 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt
0	LP10INT	R/W	0x0	LPROT10 Interrupt 1b: Interrupt, write 1 to clear 0b: No interrupt

23.1.20. SOC.DOUTSIG0

Register 23-19. SOC.DOUTSIG0 (AIO Digital Output, SOC 0x32)

BIT	NAME	ACCESS	RESET	DESCRIPTION

BIT	NAME	ACCESS	RESET	DESCRIPTION
5	AIO5DOUT	R/W	0x0	AIO5 digital out 1b: Output High Z 0b: Output VSSA
4	AIO4DOUT	R/W	0x0	AIO4 digital out 1b: Output High Z 0b: Output VSSA
3	AIO3DOUT	R/W	0x0	AIO3 digital out 1b: Output High Z 0b: Output VSSA
2	AIO2DOUT	R/W	0x0	AIO2 digital out 1b: Output High Z 0b: Output VSSA
1	AIO1DOUT	R/W	0x0	AIO1 digital out 1b: Output High Z 0b: Output VSSA
0	AIO0DOUT	R/W	0x0	AIO0 digital out 1b: Output High Z 0b: Output VSSA

23.1.21. SOC.DOUTSIG1

Register 23-20. SOC.DOUTSIG1 (AIO Digital Output, SOC 0x33)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:4	Reserved	R/W	0x0	Reserved, write to 0x0
3	AIO9DOUT	R/W	0x0	AIO9 digital out 1b: Output High Z 0b: Output VSSA
2	AIO8DOUT	R/W	0x0	AIO8 digital out 1b: Output High Z 0b: Output VSSA
1	AIO7DOUT	R/W	0x0	AIO7 digital out 1b: Output High Z 0b: Output VSSA
0	AIO6DOUT	R/W	0x0	AIO6 digital out 1b: Output High Z 0b: Output VSSA

23.1.22. SOC.DINSIG0

Register 23-21. SOC.DINSIG0 (AIO Digital Input, SOC 0x34)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:6	Reserved	R/W	0x0	Reserved, write to 0x0
5	AIO5DIN	R	0x0	AIO5 digital input 1b: Input high 0b: Input low
4	AIO4DIN	R	0x0	AIO4 digital input 1b: Input high 0b: Input low

BIT	NAME	ACCESS	RESET	DESCRIPTION
3	AIO3DIN	R	0x0	AIO3 digital input 1b: Input high 0b: Input low
2	AIO2DIN	R	0x0	AIO2 digital input 1b: Input high 0b: Input low
1	AIO1DIN	R	0x0	AIO1 digital input 1b: Input high 0b: Input low
0	AIO0DIN	R	0x0	AIO0 digital input 1b: Input high 0b: Input low

23.1.23. SOC.DINSIG1

Register 23-22. SOC.DINSIG1 (AIO Digital Input 1, SOC 0x35)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:4	Reserved	R/W	0x0	Reserved, write to 0x0
3	AIO9DIN	R	0x0	AIO9 digital input 1b: Input high 0b: Input low
2	AIO8DIN	R	0x0	AIO8 digital input 1b: Input high 0b: Input low
1	AIO7DIN	R	0x0	AIO7 digital input 1b: Input high 0b: Input low
0	AIO6DIN	R	0x0	AIO6 digital input 1b: Input high 0b: Input low

23.1.24. SOC.SIGINTM

Register 23-23. SOC.SIGINTM (AIO6,7,8,9 Interrupt Enable, SOC 0x36)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7	AIO9REINTEN	R/W	0x0	AIO9 digital input rising edge interrupt enable 1b: enabled 0b: disabled
6	AIO8REINTEN	R/W	0x0	AIO8 digital input rising edge interrupt enable 1b: enabled 0b: disabled
5	AIO7REINTEN	R/W	0x0	AIO7 digital input rising edge interrupt enable 1b: enabled 0b: disabled
4	AIO6REINTEN	R/W	0x0	AIO6 digital input rising edge interrupt enable 1b: enabled 0b: disabled
3	AIO9FEINTEN	R/W	0x0	AIO9 digital input falling edge interrupt enable 1b: enabled 0b: disabled

BIT	NAME	ACCESS	RESET	DESCRIPTION
2	AIO8FEINTEN	R/W	0x0	AIO8 digital input falling edge interrupt enable 1b: enabled 0b: disabled
1	AIO7FEINTEN	R/W	0x0	AIO7 digital input falling edge interrupt enable 1b: enabled 0b: disabled
0	AIO6FEINTEN	R/W	0x0	AIO6 digital input falling edge interrupt enable 1b: enabled 0b: disabled

23.1.25. SOC.SIGINTF

Register 23-24. SOC.SIGINTF (AIO6,7,8,9 Interrupt, SOC 0x37)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:4	Reserved	R/W	0x0	Reserved, write to 0x0
3	AIO9INT	R/W	0x0	AIO9 Interrupt 1b: Interrupt, clear by writing 1b 0b: No Interrupt
2	AIO8INT	R/W	0x0	AIO8 Interrupt 1b: Interrupt, clear by writing 1b 0b: No Interrupt
1	AIO7INT	R/W	0x0	AIO7 Interrupt 1b: Interrupt, clear by writing 1b 0b: No Interrupt
0	AIO6INT	R/W	0x0	AIO6 Interrupt 1b: Interrupt, clear by writing 1b 0b: No Interrupt

23.1.26. SOC.ENSIG

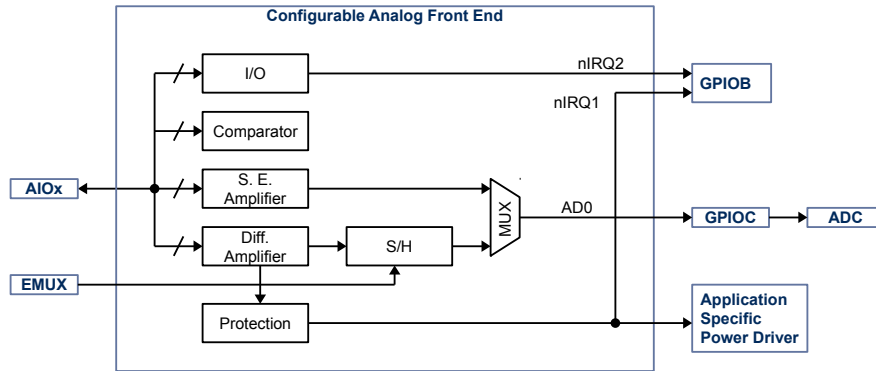

Register 23-25. SOC.ENSIG (Signal Manager Control SOC 0x38)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:1	Reserved	R/W	0x0	Reserved, write to 0x0
0	SMEN	R/W	0x0	Signal Manager Enable 1b: Enabled 0b: Disabled

23.2. Details of Operation

23.2.1. Block Diagram

Figure 23-1. Configurable Analog Front End

23.2.2. Configuration

Following blocks need to be configured for correct use of the Configurable analog frontend.

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- SOC Bridge

23.2.3. Configurable Analog Front End

The configurable analog front end registers are accessible through the SOC Bridge. AIOx can be configured as digital open drain I/Os or analog inputs.

Programmable comparators and protection circuits can be connected to the analog signals.

The analog signals can be conditioned with programmable gain single ended amplifiers or programmable gain differential amplifiers before muxed to the ADC.

23.2.3.1. Configurable Analog Front End Enable

Use **SOC.SMCTL.ENSIG** to enable the configurable analog front end.

23.2.3.2. Integrated Temperature Sensor

The CAFE contains an integrated temperature sensor that can be sampled on the AB10 analog bus. To read the temperature, sample this ADC channel and convert the ADC counts to °C by the following formula:

$$^{\circ}\text{C} = ((\text{ADC counts} - \text{TTEMPS}) \gg 1) + \text{FTTEMP}$$

23.3. AIO1, AIO0

23.3.1. Block Diagram

Figure 23-2. AIO1, AIO0

23.3.2. AIO1, AIO0

AIO1 and AIO0 can be configured as digital inputs or as differential amplifier pair with additional protection.

23.3.3. AIO1, AIO0 digital I/O Mode

Set **SOC.CFGAIO0.MODE10** = 00b to use AIO1 and AIO0 as digital inputs.

23.3.3.1. AIO0 IO

Set **SOC.CFGAIO0.OPT0** = 00b to use AIO0 as input. The input state can be read at **SOC.DINSIG0.AIO0DIN**.

Set **SOC.CFGAIO0.OPT0** = 10b to use AIO0 as open drain output. Set **SOC.CFGAIO0.MUX0** = 00b to mux the output state from **SOC.DOUTSIG0.AIO0DOUT**. Use **SOC.CFGAIO0.MUX0** to mux the output signal from the internal digital bus DBUS DB1 to DB7.

23.3.3.2. AIO1 IO

Set **SOC.CFGAIO1.OPT1** = 00b to use AIO1 as input. The input state can be read at **SOC.DINSIG0.AIO1DIN**.

Set **SOC.CFGAIO1.OPT1** = 10b to use AIO1 as open drain output. Set **SOC.CFGAIO1.MUX1** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO1DOUT**. Use **SOC.CFGAIO1.MUX1** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.3.3.3. AIO0 Polarity

Use **SOC.CFGAIO0.POL0** to set logic polarity of the signal between AIO0 input/output and MUX0.

23.3.3.4. AIO1 Polarity

Use **SOC.CFGAIO0.POL1** to set logic polarity of the signal between AIO1 input/output and MUX1.

23.3.4. AIO1, AIO0 differential Amplifier Mode

Set **SOC.CFGAIO0.MODE10** = 01b to use AIO1 and AIO0 as input to a differential amplifier.

23.3.4.1. AIO1, AIO0 Differential Amplifier Gain

Use **SOC.CFGAIO0.GAIN10** to set to gain between 1x to 48x.

23.3.4.2. AIO1, AIO0 Differential Amplifier Reference

Use **SOC.CFGAIO1.OS10EN** to set the amplifier reference either VSSA or VREF/2.

23.3.4.3. AIO1, AIO0 Differential Amplifier Calibration

Use **SOC.1.CAL10EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.3.5. AIO1, AIO0 Protection

In **SOC.CFGAIO0.MODE10** = 01b differential amplifier mode, a high side comparator protector HP10 and a low side comparator protector LP10 are also active that can be configured to disabled high-side or low-side drivers

in the application specific power driver section.

23.3.5.1. HP10 Comparator

The HP10 comparator takes the AIO1 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO1.HP10EN** to enable HP10 comparator with different blanking times.

Use **SOC.SIGSET.HPROTHYS** to enable HP10 comparator hysteresis.

The output of HP10 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO1.HP10PR1EN** or protection signal PR2 using **SOC.AIO1CFG.HP10PR2EN**.

The output of HP10 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP10INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP10INT**.

23.3.5.2. LP10 Comparator

The LP10 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO0.LP10EN** to enable LP10 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP10 comparator hysteresis.

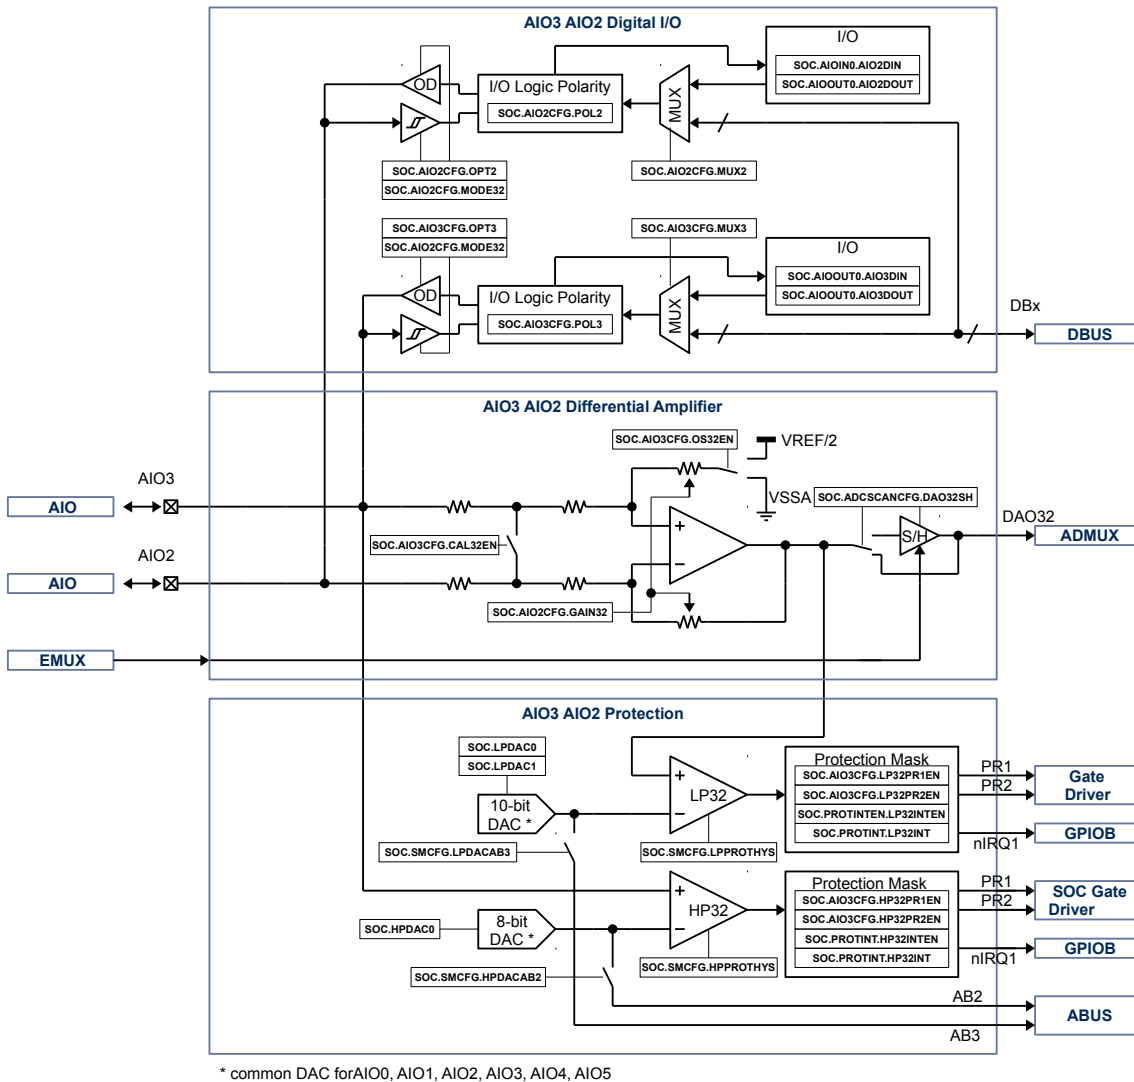

The output of LP10 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO1.LP10PR1EN** or protection signal PR2 using **SOC.CFGAIO1.LP10PR2EN**.

The output of LP10 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP10INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP10INT**.

23.4. AIO3, AIO2

23.4.1. Block Diagram

Figure 23-3. AIO3, AIO2

23.4.2. AIO3, AIO2

AIO3 and AIO2 can be configured as digital inputs or as differential amplifier pair with additional protection.

23.4.3. AIO3, AIO2 digital I/O Mode

Set `SOC.CFGAIO2.MODE32 = 00b` to use AIO3 and AIO2 as digital inputs.

23.4.3.1. AIO2 IO

Set **SOC.CFGAIO2.OPT2** = 00b to use AIO2 as input. The input state can be read at **SOC.DINSIG0.AIO2DIN**.

Set **SOC.CFGAIO2.OPT2** = 10b to use AIO2 as open drain output. Set **SOC.CFGAIO2.MUX2** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO2DOUT**. Use **SOC.CFGAIO2.MUX2** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.4.3.2. AIO3 IO

Set **SOC.CFGAIO3.OPT3** = 00b to use AIO3 as input. The input state can be read at **SOC.DINSIG0.AIO3DIN**.

Set **SOC.CFGAIO3.OPT3** = 10b to use AIO3 as open drain output. Set **SOC.CFGAIO3.MUX3** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO3DOUT**. Use **SOC.CFGAIO3.MUX3** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.4.3.3. AIO2 Polarity

Use **SOC.CFGAIO2.POL2** to set logic polarity of the signal between AIO2 input/output and MUX2.

23.4.3.4. AIO3 Polarity

Use **SOC.CFGAIO3.POL3** to set logic polarity of the signal between AIO3 input/output and MUX3.

23.4.4. AIO3, AIO2 differential Amplifier Mode DAO32

Set **SOC.CFGAIO2.MODE32** = 01b to use AIO3 and AIO2 as input to a differential amplifier DAO32.

23.4.4.1. DAO32 Differential Amplifier Gain

Use **SOC.CFGAIO2.GAIN32** to set to gain between 1x to 48x.

23.4.4.2. DAO32 Differential Amplifier Reference

Use **SOC.CFGAIO3.OS32EN** to set the amplifier reference either VSSA or VREF/2.

23.4.4.3. DAO32 Differential Amplifier Calibration

Use **SOC.CFGAIO3.CAL32EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.4.5. AIO3, AIO2 Protection

In **SOC.CFGAIO2.MODE32** = 01b differential amplifier mode, a high side comparator protector HP10 and a low

side comparator protector LP10 are also active that can be configured to disabled high-side or low-side drivers in the application specific power driver section.

23.4.5.1. HP32 Comparator

The HP32 comparator takes the AIO3 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO3.HP32EN** to enable HP32 comparator with different blanking times.

Use **SOC.SIGSET.HPPROTHYS** to enable HP32 comparator hysteresis.

The output of HP32 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO3.HP32PR1EN** or protection signal PR2 using **SOC.CFGAIO3.HP32PR2EN**.

The output of HP32 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP32INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP32INT**.

23.4.5.2. LP32 Comparator

The LP32 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO2.LP32EN** to enable LP32 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP32 comparator hysteresis.

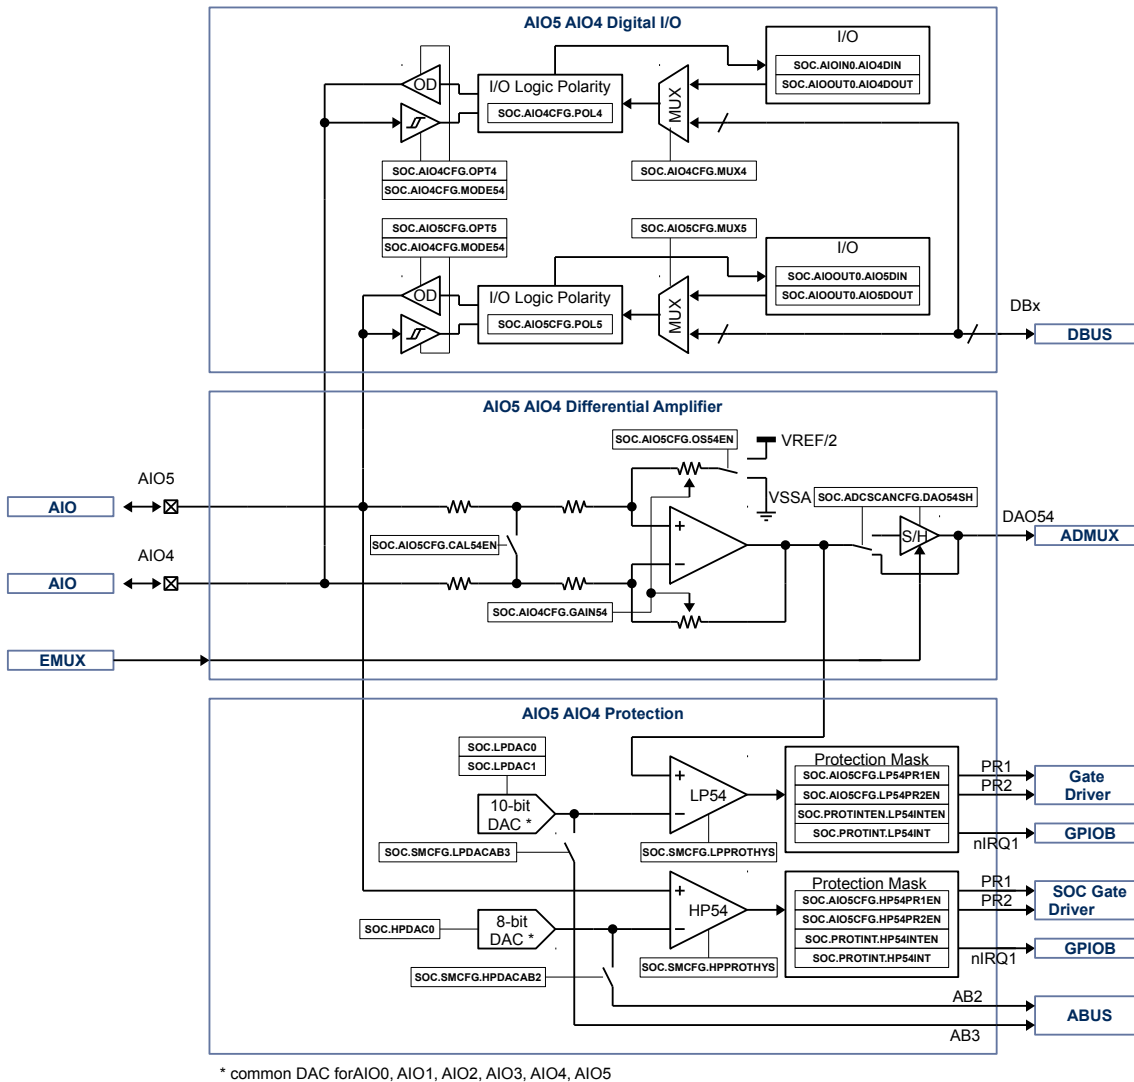

The output of LP32 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO3.LP32PR1EN** or protection signal PR2 using **SOC.CFGAIO3.LP32PR2EN**.

The output of LP32 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP32INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP32INT**.

23.5. AIO5, AIO4

23.5.1. Block Diagram

Figure 23-4. AIO5, AIO4

23.5.2. AIO5, AIO4

AIO5 and AIO4 can be configured as digital inputs or as differential amplifier pair with additional protection.

23.5.3. AIO5, AIO4 digital I/O Mode

Set `SOC.CFGAIO4.MODE54 = 00b` to use AIO5 and AIO4 as digital inputs.

23.5.3.1. AIO4 IO

Set **SOC.CFGAIO4.OPT4** = 00b to use AIO4 as input. The input state can be read at **SOC.DINSIG0.AIO4DIN**.

Set **SOC.CFGAIO4.OPT4** = 10b to use AIO4 as open drain output. Set **SOC.CFGAIO4.MUX4** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO4DOUT**. Use **SOC.CFGAIO4.MUX4** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.5.3.2. AIO5 IO

Set **SOC.CFGAIO5.OPT5** = 00b to use AIO5 as input. The input state can be read at **SOC.DINSIG0.AIO5DIN**.

Set **SOC.CFGAIO5.OPT5** = 10b to use AIO5 as open drain output. Set **SOC.CFGAIO5.MUX5** = 00b to MUX the output state from **SOC.DOUTSIG0.AIO5DOUT**. Use **SOC.CFGAIO5.MUX5** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.5.3.3. AIO4 Polarity

Use **SOC.CFGAIO4.POL4** to set logic polarity of the signal between AIO4 input/output and MUX4.

23.5.3.4. AIO5 Polarity

Use **SOC.CFGAIO5.POL5** to set logic polarity of the signal between AIO5 input/output and MUX5.

23.5.4. AIO5, AIO4 differential Amplifier Mode DAO54

Set **SOC.CFGAIO4.MODE54** = 01b to use AIO5 and AIO4 as input to a differential amplifier DAO54.

23.5.4.1. DAO54 Differential Amplifier Gain

Use **SOC.CFGAIO4.GAIN54** to set to gain between 1x to 48x.

23.5.4.2. DAO54 Differential Amplifier Reference

Use **SOC.CFGAIO5.OS54EN** to set the amplifier reference either VSSA or VREF/2.

23.5.4.3. DAO54 Differential Amplifier Calibration

Use **SOC.CFGAIO5.CAL54EN** to short the input of the differential amplifier to allow reading of the amplifier offset.

23.5.5. AIO5, AIO4 Protection

In **SOC.CFGAIO4.MODE54** = 01b differential amplifier mode, a high side comparator protector HP54 and a low

side comparator protector LP54 are also active that can be configured to disabled high-side or low-side drivers in the application specific power driver section.

23.5.5.1. HP54 Comparator

The HP54 comparator takes the AIO5 voltage referenced to VSSA and compares it against the HP-DAC voltage. The 8-bit HP-DAC is programmable with **SOC.HPDAC**.

Use **SOC.CFGAIO5.HP54EN** to enable HP54 comparator with different blanking times.

Use **SOC.SIGSET.HPPROTHYS** to enable HP54 comparator hysteresis.

The output of HP54 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO5.HP54PR1EN** or protection signal PR2 using **SOC.CFGAIO5.HP54PR2EN**.

The output of HP54 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.HP54INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.HP54INT**.

23.5.5.2. LP54 Comparator

The LP54 comparator takes the output of the differential amplifier and compares it against the LP-DAC voltage. The 10-bit LP-DAC is programmable with **SOC.LPDAC0** and **SOC.LPDAC1**.

Use **SOC.CFGAIO4.LP54EN** to enable LP54 comparator with different blanking times.

Use **SOC.SIGSET.LPPROTHYS** to enable LP54 comparator hysteresis.

The output of LP54 comparator can be configured to trigger protection signal PR1 using **SOC.CFGAIO5.LP54PR1EN** or protection signal PR2 using **SOC.CFGAIO5.LP54PR2EN**.

The output of LP54 can also trigger the nIRQ1 interrupt using **SOC.PROTINTM.LP54INTEN**. The interrupt status can be observed with **SOC.PROTSTAT.LP54INT**.

23.6. AIO6

23.6.1. Block Diagram

Figure 23-5. AIO6

23.6.2. AIO6

AIO6 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.6.3. AIO6 digital I/O Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 00b to use AIO6 as digital IO.

23.6.3.1. AIO6 IO

Set **SOC.CFGAIO6.OPT6** = 00b to use AIO6 as input. The input state can be read at **SOC.DINSIG1.AIO6DIN**.

Set **SOC.CFGAIO6.OPT6** = 10b to use AIO6 as open drain output. Set **SOC.CFGAIO6.MUX6** = 00b to MUX the output state from **SOC.DOUTSIG1.AIO6DOUT**. Use **SOC.CFGAIO6.MUX6** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.6.3.2. AIO6 IO Interrupt

Set **SOC.SIGINTM.AIO6REINTEN** to allow nIRQ2 interrupt on AIO6 low high transition.

Set **SOC.SIGINTM.AIO6FEINTEN** to allow nIRQ2 interrupt on AIO6 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO6INT** and cleared by writing **SOC.SIGINTF.AIO6INT** to 1b.

23.6.3.3. AIO6 Polarity

Use **SOC.CFGAIO6.POL6** to set logic polarity of the signal between AIO6 input/output and MUX6.

23.6.4. AIO6 Single Ended Amplifier Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 01b to use AIO6 as input to a programmable gain amplifier.

23.6.4.1. AIO6 Amplifier Gain

Use **SOC.CFGAIO6.GAIN6** to set to gain between 1x to 48x or bidirectional amplifier bypassmode.

23.6.4.2. AIO6 Analog MUX

Use **SOC.CFGAIO6.MUX6** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.6.5. AIO6 Comparator Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 10b to use AIO6 in comparator mode.

23.6.5.1. AIO6 Comparator Hysteresis

Use **SOC.SIGSET.AIO6HYS** to enable AIO6 comparator hysteresis.

23.6.5.2. AIO6 Comparator setting

Use **SOC.CFGAIO6.OPT6** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.6.5.3. AIO6 Comparator Polarity

Use **SOC.CFGAIO6.POL6** to set the output polarity of the comparator.

23.6.5.4. AIO6 Comparator Output MUX

Use **SOC.AIO6CFG.MUX6** to set the output of the comparator to the digital bus DB1 to DB7 or **SOC.AIOIN1.AIO6DIN**.

23.6.6. AIO6 Special Mode

Set **SOC.PWRSTAT.PBEN** = 0b and **SOC.CFGAIO6.MODE6** = 11b to use AIO6 in special mode. In special mode the AIO6 can output a buffered signal from the internal ABUS, AB1 to AB7.

23.6.6.1. AIO6 Special Mode MUX

Use **SOC.CFGAIO6.MUX6** to set the ABx channel output to AIO6.

23.6.6.2. AIO6 Special Mode ADMUX

Use **SOC.CFGAIO6.ADMUX** set the MUX the ADMUX output to AB7.

23.6.6.3. AIO6 Special Mode OFFSET SWAP

Use **SOC.CFGAIO6.SWAP** to swap the random offset of the buffer for calibration reasons.

23.6.7. AIO6 Push Button Mode

Set **SOC.PWRSTAT.PBEN** = 1b to enable AIO6 Hibernate push button mode, where AIO6 has an internal weak pull up also active in hibernate mode. Set **SOC.PWRSTAT.PBINTEN** = 1b to enable nIRQ1 interrupt. Use **SOC.PWRSTAT.PBINT** to monitor interrupt status and write 1b to clear interrupt.

23.6.7.1. AIO6 Push Button Wake Up

In Hibernate Wake Mode and enabled push button mode, if AIO6 is pulled low for the de-bouncing time period, the **SOC.PWRCTL.HIB** is cleared and the device powers up.

23.6.7.2. AIO6 Push Button Power Down

In normal mode the **SOC.PWRSTAT.PBINT** is set when AIO6 is pulled low for the de-bouncing time period. The system then can be put into hibernate mode by setting **SOC.PWRCTL.HIB** = 1b.

23.6.7.3. AIO6 Push Button Hard Reset

In normal operation if the AIO6 is pulled low for more than 8s, the nRST signal will be asserted and the MCU is reset. **SOC.PWRSTAT.HWRESET** is set to indicate this condition.

23.7. AIO7

23.7.1. Block Diagram

Figure 23-6. AIO7

23.7.2. AIO7

AIO7 can be configured as digital input, as single ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.7.3. AIO7 digital I/O Mode

Set **SOC.CFGAIO7.MODE7** = 00b to use AIO7 as digital IO.

23.7.3.1. AIO7 IO

Set **SOC.CFGAIO7.OPT7** = 00b to use AIO7 as input. The input state can be read at **SOC.DINSIG1.AIO7DIN**.

Set **SOC.CFGAIO7.OPT7** = 10b to use AIO7 as open drain output. Set **SOC.CFGAIO7.MUX7** = 00b to MUX the output state from **SOC.DOUTSIG1.AIO7DOUT**. Use **SOC.CFGAIO7.MUX7** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.7.3.2. AIO7 IO Interrupt

Set **SOC.SIGINTM.AIO7REINTEN** to allow nIRQ2 interrupt on AIO7 low high transition.

Set **SOC.SIGINTM.AIO7FEINTEN** to allow nIRQ2 interrupt on AIO7 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO7INT** and cleared by writing **SOC.SIGINTF.AIO7INT** to 1b.

23.7.3.3. AIO7 Polarity

Use **SOC.CFGAIO7.POL7** to set logic polarity of the signal between AIO7 input/output and MUX7.

23.7.4. AIO7 Single Ended Amplifier Mode

Set **SOC.CFGAIO7.MODE7** = 01b to use AIO7 as input to a programmable gain amplifier.

23.7.4.1. AIO7 Amplifier Gain

Use **SOC.CFGAIO7.GAIN7** to set to gain between 1x to 48x or bidirectional amplifier bypassmode.

23.7.4.2. AIO7 Analog MUX

Use **SOC.CFGAIO7.MUX7** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.7.5. AIO7 Comparator Mode

Set **SOC.CFGAIO7.MODE7** = 10b to use AIO7 in comparator mode.

23.7.5.1. AIO7 Comparator Hysteresis

Use **SOC.SIGSET.AIO7HYS** to enable AIO7 comparator hysteresis.

23.7.5.2. AIO7 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.7.5.3. AIO7 Comparator Polarity

Use **SOC.CFGAIO7.POL7** to set the output polarity of the comparator.

23.7.5.4. AIO7 Comparator Output

The comparator output can be observed with **SOC.DINSIG1.AIO7DIN**.

23.7.6. AIO7 Special Mode

Set **SOC.CFGAIO7.MODE7** = 11b to use AIO7 in special mode. In special mode the AIO7 comparator is enabled.

23.7.6.1. AIO7 Comparator Hysteresis

Use **SOC.SIGSET.AIO7HYS** to enable AIO7 comparator hysteresis.

23.7.6.2. AIO7 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2 or AB3.

23.7.6.3. AIO7 Comparator Reference Star Point

Use **SOC.CFGAIO9.MODE9[0]** =1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

With **SOC.CFGAIO9.MODE9[0]** =0b, the AB1 reference could for example come from AIO6 in amplifier mode **SOC.CFGAIO6.MODE6** = 01b and **SOC.CFGAIO6.GAIN6** = 000b direct mode and **SOC.CFGAIO6.MUX6** = 1b.

23.7.6.4. AIO7 Voltage Reading

Use **SOC.CFGAIO9.MODE9[1]** =1b to MUX AIO7 to AB7 with 40% attenuation, so ADC can read out AIO7 voltage.

23.7.6.5. AIO7 Comparator Output

Use **SOC.CFGAIO9.OPT9** to select AIO7, AIO8 or AIO9 comparator output signal for POS.

23.7.6.6. AIO7 POS S/H Bypass

Set **SOC.CFGAIO8.OPT8[1]** =0b bypass the POS S/H.

Set **SOC.CFGAIO8.OPT8[1]** =1b use POS S/H for use with EMUX.

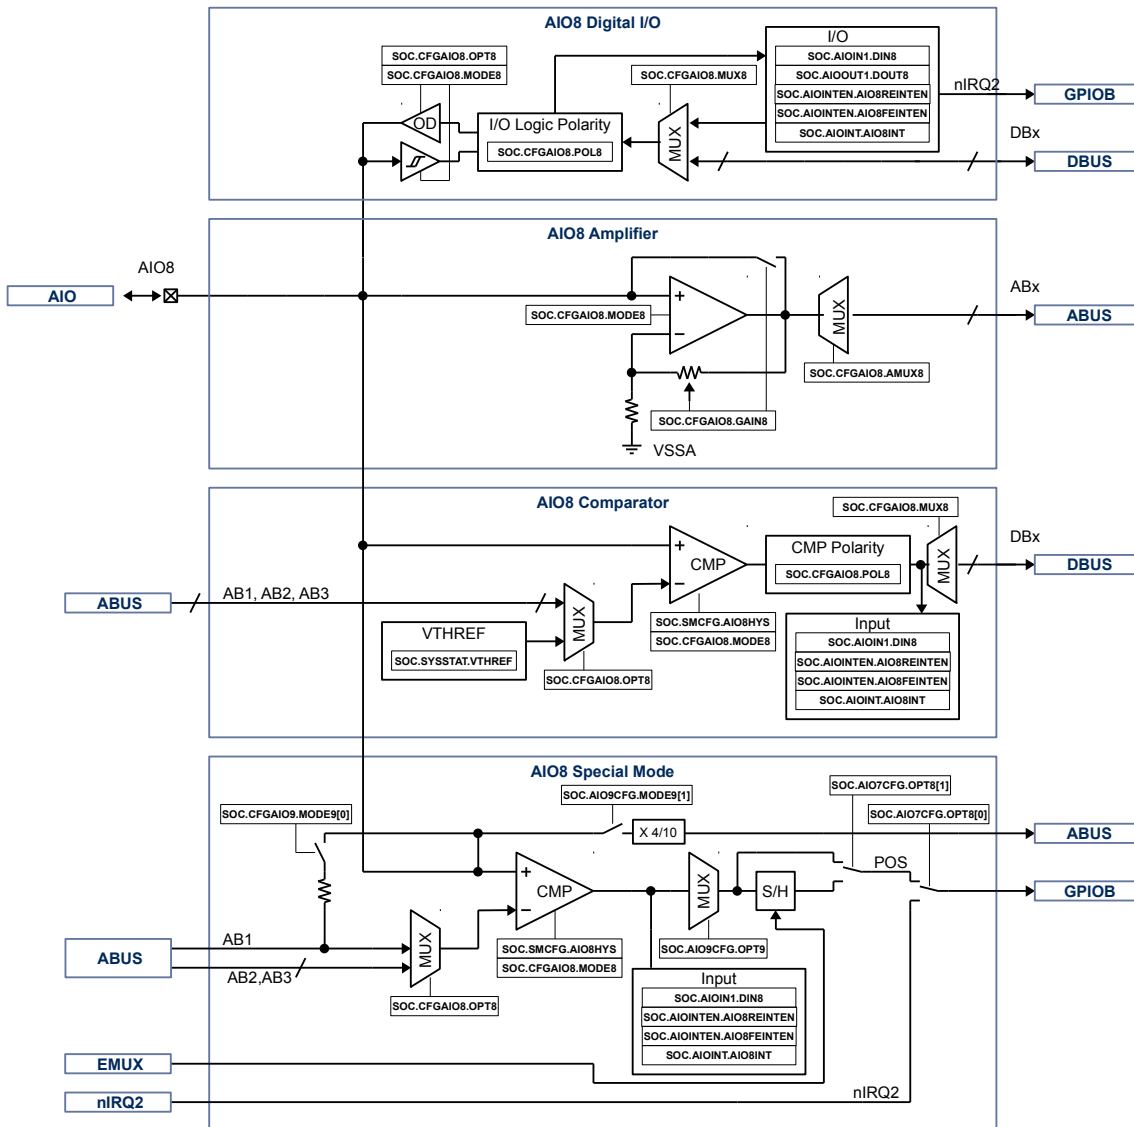

23.7.6.7. AIO7 nIRQ2/POS Selector

Use **SOC.CFGAIO8.OPT8[0]** to select POS or nIRQ2 output.

23.8. AIO8

23.8.1. Block Diagram

Figure 23-7. AIO8

23.8.2. AIO8

AIO8 can be configured as digital input, as singled ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.8.3. AIO8 digital I/O Mode

Set **SOC.CFGAIO8.MODE8** = 00b to use AIO8 as digital IO.

23.8.3.1. AIO8 IO

Set **SOC.CFGAIO8.OPT8** = 00b to use AIO8 as input. The input state can be read at **SOC.DINSIG0.AIO8DIN**.

Set **SOC.CFGAIO8.OPT8** = 10b to use AIO8 as open drain output. Set **SOC.CFGAIO8.MUX8** = 00b to MUX the output state from **SOC.DCOUTSIG0.AIO8DOUT**. Use **SOC.CFGAIO8.MUX8** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.8.3.2. AIO8 IO Interrupt

Set **SOC.SIGINTM.AIO8REINTEN** to allow nIRQ2 interrupt on AIO8 low high transition.

Set **SOC.SIGINTM.AIO8FEINTEN** to allow nIRQ2 interrupt on AIO8 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO8INT** and cleared by writing **SOC.SIGINTF.AIO8INT** to 1b.

23.8.3.3. AIO8 Polarity

Use **SOC.CFGAIO8.POL8** to set logic polarity of the signal between AIO8 input/output and MUX8.

23.8.4. AIO8 Single Ended Amplifier Mode

Set **SOC.CFGAIO8.MODE8** = 01b to use AIO8 as input to a programmable gain amplifier.

23.8.4.1. AIO8 Amplifier Gain

Use **SOC.CFGAIO8.GAIN8** to set to gain between 1x to 48x or bidirectional amplifier bypass mode.

23.8.4.2. AIO8 Analog MUX

Use **SOC.CFGAIO8.MUX8** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.8.5. AIO8 Comparator Mode

Set **SOC.CFGAIO8.MODE8** = 10b to use AIO8 in comparator mode.

23.8.5.1. AIO8 Comparator Hysteresis

Use **SOC.SIGSET.AIO8HYS** to enable AIO8 comparator hysteresis.

23.8.5.2. AIO8 Comparator Reference

Use **SOC.CFGAIO8.OPT8** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.8.5.3. AIO8 Comparator Polarity

Use **SOC.CFGAIO8.POL8** to set the output polarity of the comparator.

23.8.5.4. AIO8 Comparator Output

The comparator output can be observed with **SOC.DINSIG1.AIO8DIN**.

23.8.6. AIO8 Special Mode

Set **SOC.CFGAIO7.MODE7** = 11b to use AIO8 in special mode. In special mode the AIO8 comparator is enabled.

23.8.6.1. AIO8 Comparator Hysteresis

Use **SOC.SIGSET.AIO8HYS** to enable AIO8 comparator hysteresis.

23.8.6.2. AIO8 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2 or AB3.

23.8.6.3. AIO8 Comparator Reference Star Point

Use **SOC.CFGAIO9.MODE9[0]** =1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

With **SOC.CFGAIO9.MODE9[0]** =0b, the AB1 reference could for example come from AIO6 in amplifier mode **SOC.CFGAIO6.MODE6** = 01b and **SOC.CFGAIO6.GAIN6** = 000b direct mode and **SOC.CFGAIO6.MUX6** = 1b.

23.8.6.4. AIO8 Voltage Reading

Use **SOC.CFGAIO9.MODE9[1]** =1b to MUX AIO8 to AB8 with 40% attenuation, so ADC can read out AIO8 voltage.

23.8.6.5. AIO8 Comparator Output

Use **SOC.CFGAIO9.OPT9** to select AIO7, AIO8 or AIO9 comparator output signal for POS.

23.8.6.6. AIO8 POS S/H Bypass

Set **SOC.CFGAIO8.OPT8[1]** =0b bypass the POS S/H.

Set **SOC.CFGAIO8.OPT8[1]** =1b use POS S/H for use with EMUX.

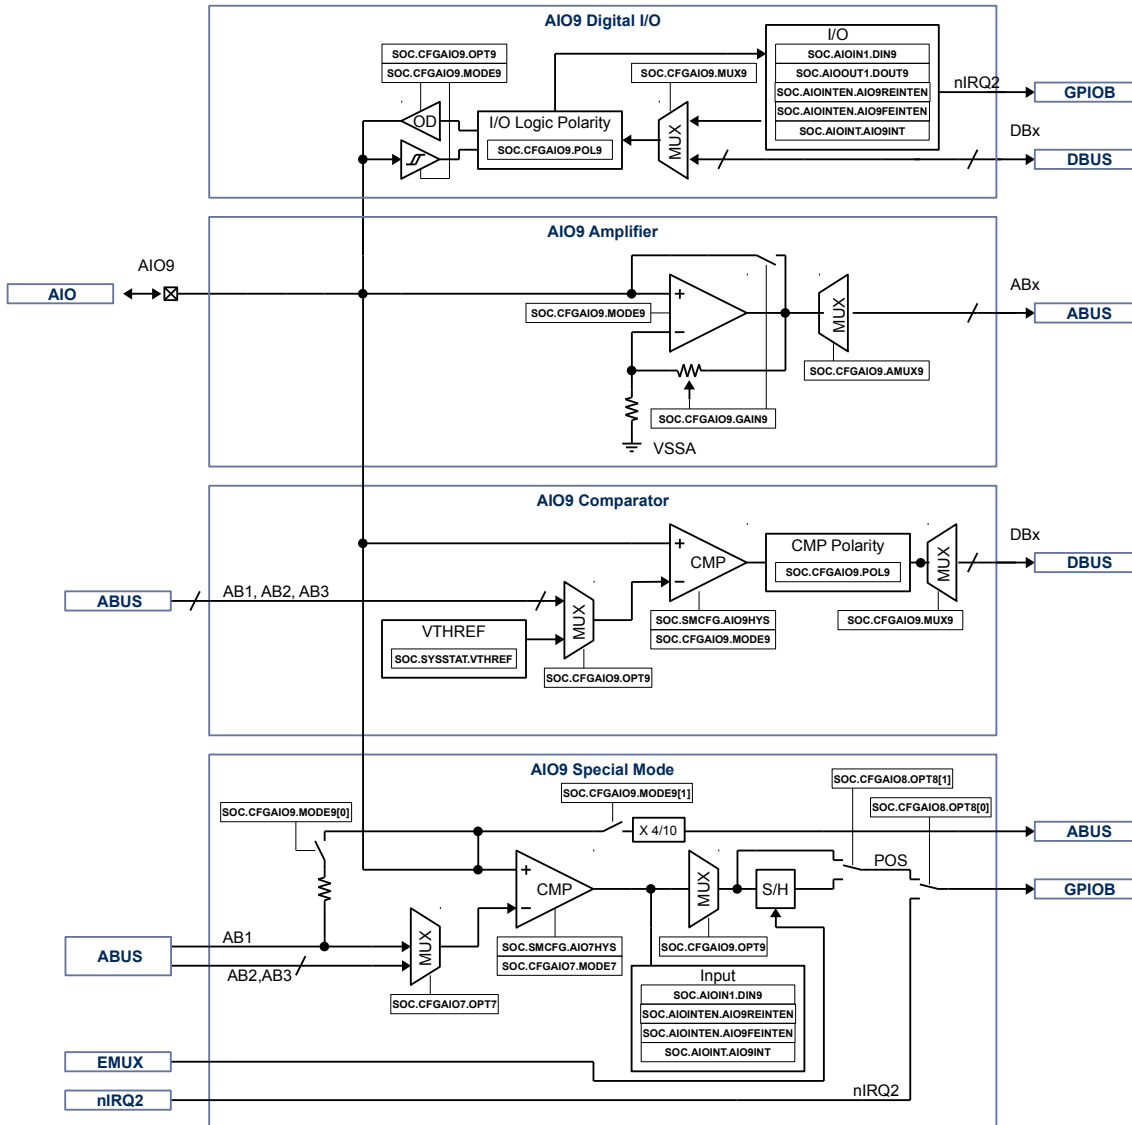

23.8.6.7. AIO8 nIRQ2/POS Selector

Use **SOC.CFGAIO8.OPT8[0]** to select POS or nIRQ2 output.

23.9. AIO9

23.9.1. Block Diagram

Figure 23-8. AIO9

23.9.2. AIO9

AIO9 can be configured as digital input, as single ended programmable gain amplifier, as comparator, as output from the analog ABUS or as push button input to wake up the device from low power hibernate mode.

23.9.3. AIO9 digital I/O Mode

Set **SOC.CFGAIO9.MODE9** = 00b to use AIO9 as digital IO.

23.9.3.1. AIO9 IO

Set **SOC.CFGAIO9.OPT9** = 00b to use AIO9 as input. The input state can be read at **SOC.DINSIG1.AIO9DIN**.

Set **SOC.CFGAIO9.OPT9** = 10b to use AIO9 as open drain output. Set **SOC.CFGAIO9.MUX9** = 00b to MUX the output state from **SOC.DOUTSIG1.AIO9DOUT**. Use **SOC.CFGAIO9.MUX9** to MUX the output signal from the internal digital bus DBUS DB1 to DB7.

23.9.3.2. AIO9 IO Interrupt

Set **SOC.SIGINTM.AIO9REINTEN** to allow nIRQ2 interrupt on AIO8 low high transition.

Set **SOC.SIGINTM.AIO9FEINTEN** to allow nIRQ2 interrupt on AIO8 high low transition.

The interrupt status can be monitored with **SOC.SIGINTF.AIO9INT** and cleared by writing **SOC.SIGINTF.AIO9INT** to 1b.

23.9.3.3. AIO9 Polarity

Use **SOC.CFGAIO9.POL9** to set logic polarity of the signal between AIO9 input/output and MUX9.

23.9.4. AIO9 Single Ended Amplifier Mode

Set **SOC.CFGAIO9.MODE9** = 01b to use AIO9 as input to a programmable gain amplifier.

23.9.4.1. AIO9 Amplifier Gain

Use **SOC.CFGAIO9.GAIN9** to set to gain between 1x to 48x or bidirectional amplifier bypass mode.

23.9.4.2. AIO9 Analog MUX

Use **SOC.CFGAIO9.MUX9** to switch the output of the amplifier to analog channel AB1 to AB7 on the analog bus ABUS.

23.9.5. AIO9 Comparator Mode

Set **SOC.CFGAIO9.MODE9** = 10b to use AIO9 in comparator mode.

23.9.5.1. AIO9 Comparator Hysteresis

Use **SOC.SIGSET.AIO9HYS** to enable AIO9 comparator hysteresis.

23.9.5.2. AIO9 Comparator Reference

Use **SOC.CFGAIO9.OPT9** to set the compare value of the comparator to AB1, AB2, AB3 or VTHREF, settable with **SOC.SYSSTAT.VTHREF**.

23.9.5.3. AIO9 Comparator Polarity

Use **SOC.CFGAIO9.POL9** to set the output polarity of the comparator.

23.9.5.4. AIO9 Comparator Output

The comparator output can be observed with **SOC.DINSIG1.AIO9DIN**.

23.9.6. AIO9 Special Mode

Set **SOC.CFGAIO7.MODE7** = 11b to use AIO9 in special mode. In special mode the AIO9 comparator is enabled.

23.9.6.1. AIO9 Comparator Hysteresis

Use **SOC.SIGSET.AIO9HYS** to enable AIO9 comparator hysteresis.

23.9.6.2. AIO9 Comparator Reference

Use **SOC.CFGAIO7.OPT7** to set the compare value of the comparator to AB1, AB2 or AB3.

23.9.6.3. AIO9 Comparator Reference Star Point

Use **SOC.CFGAIO9.MODE9[0]** =1b to connect AIO7, AIO8 and AIO9 to AB1 with a 100kOhm resistor to create a star point reference for the comparator.

With **SOC.CFGAIO9.MODE9[0]** =0b, the AB1 reference could for example come from AIO6 in amplifier mode **SOC.CFGAIO6.MODE6** = 01b and **SOC.CFGAIO6.GAIN6** = 000b direct mode and **SOC.CFGAIO6.MUX6** = 1b.

23.9.6.4. AIO9 Voltage Reading

Use **SOC.CFGAIO9.MODE9[1]** =1b to MUX AIO9 to AB9 with 40% attenuation, so ADC can read out AIO9 voltage.

23.9.6.5. AIO9 Comparator Output

Use **SOC.CFGAIO9.OPT9** to select AIO7, AIO8 or AIO9 comparator output signal for POS.

23.9.6.6. AIO9 POS S/H Bypass

Set **SOC.CFGAIO8.OPT8[1]** =0b bypass the POS S/H.

Set **SOC.CFGAIO8.OPT8[1]** =1b use POS S/H for use with EMUX.

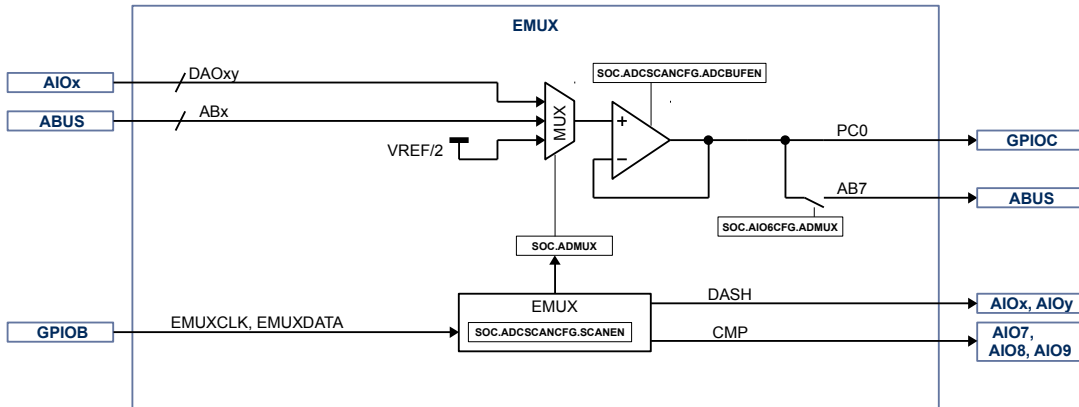

23.9.6.7. AIO9 nIRQ2/POS Selector

Use **SOC.CFGAIO8.OPT8[0]** to select POS or nIRQ2 output.

23.10. EMUX and ADMUX

23.10.1. Block Diagram

Figure 23-9. EMUX

23.10.2. EMUX

The EMUX is a dedicated high speed low latency serial interface to control the ADMUX, the AIO7, AIO8, AIO9 POS S/H and the DAOxy S/H using the ASC0, ASC1 sequencer.

23.10.2.1. EMUX Enable

Set **SOC.ADCSCAN.SCANEN** = 01b enable the EMUX control of the **SOC.ADIN1** and the DAOxy S/H.

23.10.2.2. EMUXD Packet Structure

The EMUXD packet is transmitted MSB first.

Register 23-26. EMUX Packet Structure

BIT	NAME	DESCRIPTION
7:6	C	Header, write to 01b
5	SH1	Enable Sample and Hold for all BEMF comparators 1b: Hold POS value 0b: Sample POS value
4	SH0	Enable Sample and Hold for AIO10, AIO32 or AIO54 1b: Hold DAOxy value 0b: Sample DAOxy

BIT	NAME	DESCRIPTION
3:0	MUX	AD MUX Channel Selector 1111b: VREF / 2 1110b: AB12 1101b: AB11 1100b: AB10 1011b: AB9 1010b: AB8 1001b: AB7 1000b: AB6 0111b: AB5 0110b: AB4 0101b: AB3 0100b: AB2 0011b: AB1 0010b: DAO54 0001b: DAO32 0000b: DAO10

23.10.2.3. EMUX Timing

The EMUXD packet is transmitted MSB first.

The header C1, C2 is fixed and need to be written to 01b.

The POS S/H is toggled based on the CMP bit in the EMUXD packet with the falling edge of the 3th clock cycle.

The DAOxy S/H is toggled based on the DASH bit in the EMUXD packet with the falling edge of the 4th clock cycle.

The ADMUX is switched with the falling edge of the 8th clock based on the data of bits 3:1 of the EMUXD packet.

Figure 23-10. EMUX Timing

23.10.3. ADMUX

The ADMUX is a dedicated analog MUX in the configurable analog front-end.

23.10.3.1. ADMUX Control

Use **SOC.ADIN1** to set the channel for the ADMUX.

When EMUX is enabled, the SOC.ADMUX can be controlled directly from the ASC0, ASC1 sequencers using EMUXD.

23.10.3.2. ADMUX Buffer

Use **SOC.ADCSCAN.ADCBUFEN** to enable the ADMUX buffer.

23.10.3.3. ADMUX

Use **SOC.AIO6CFG.ADIN1** to route the output of the ADMUX to AB7 for debug purposes.

24. APPLICATION SPECIFIC POWER DRIVER

24.1. Register

24.1.1. Register Map

Table 24-1. Application Specific Power Driver Register Map

SOC ADDRESS	NAME	DESCRIPTION	RESET VALUE
Application Specific Power Driver			
0x60	SOC.CFGDRV0	Driver Configuration 0	0x00
0x61	SOC.CFGDRV1	Driver configuration 1	0x00
0x62	SOC.CFGDRQ6	OHI6 Configuration	0x00
0x63	SOC.CFGDRQ7	OHI7 Configuration	0x00
0x64	SOC.DOUTDRV	OHx6/7, OM0/2/4 output control	0x00

24.1.8. SOC.ENDRV

Register 24-7. SOC.ENDRV (Application Specific Power Driver Control, SOC 0x66)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:1	Reserved	R/W	0x0	Reserved, write to 0x0
0	DRVEN	R/W	0x0	Application Specific Power Driver Enable 1b: enabled 0b: disabled

24.1.9. SOC.PROTCTL

Register 24-8. SOC.PROTCTL (PROT Control, SOC 0x67)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:1	Reserved	R/W	0x0	Reserved, write to 0x0
0	PROTSEL	R/W	0x0	Select input signal for PROT 1b: nIRQ2, DB5, DB6 or DB7 0b: PR1

24.1.10. SOC.HDTCTL

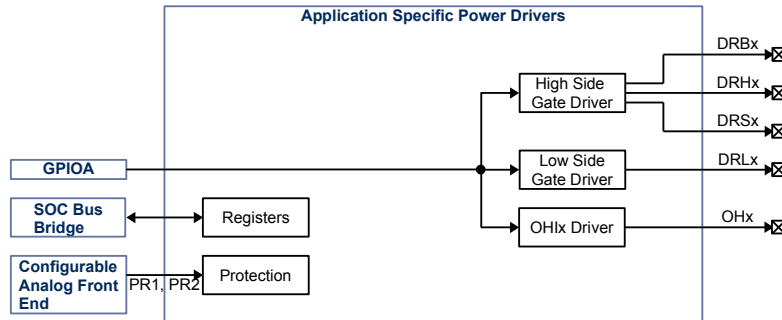

Register 24-9. SOC.HDTCTL (Hardware Deadtime Control, SOC 0x68)

BIT	NAME	ACCESS	RESET	DESCRIPTION
7:1	Reserved	R/W	0x0	Reserved, write to 0x0
0	HDTEN	R/W	0x0	Hardware dead time control for DRLx, DRHx 1b: 100ns 0b: 50ns

24.2. Details of Operation

24.2.1. Block Diagram

Figure 24-1. Application Specific Power Driver

24.2.2. Configuration

Following blocks need to be configured for correct use of the Application specific power driver

- Clock Control System (CCS)
- Nested Vectored Interrupt Controller (NVIC)
- IO Controller
- SOC Bridge

24.2.3. Application Specific Power Driver

The application specific power driver registers are accessible through the SOC Bridge. The Ultra high side drivers OXHx, high side drivers DRHx, low side drivers DRLx and general purpose open drain drivers OPx can be controlled by timer PWMs. The OMx and OHlx open drain drivers are controlled by SOC registers.

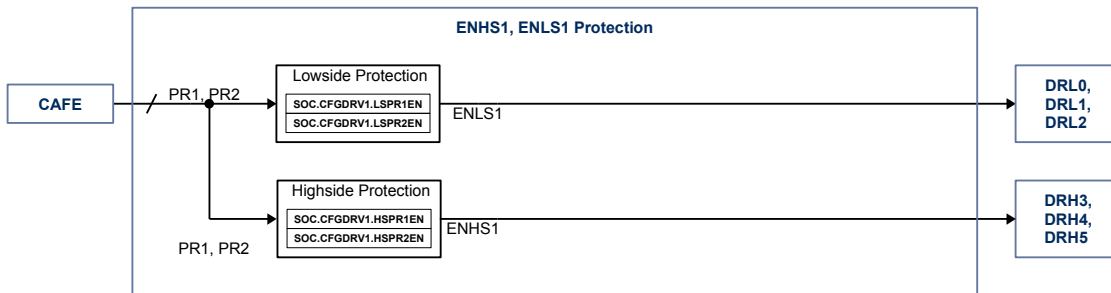

24.2.3.1. Application Specific Power Driver Enable

Use **SOC.DRVCTL.ENDRV** to enable the application specific power driver.

24.3. ENHS1, ENLS1 Protection

24.3.1. Block Diagram

Figure 24-2. ENHS1, ENLS1 Protection

24.3.2. ENHS1, ENLS1 Protection

The PR1, PR2 signals from the AIOx inputs in the configurable analog front-end can be used to disable the gate drivers in the application specific power drivers, separated in 2 groups.

The ENHS1 signal protects DRH3, DRH4, DRH5.

The ENLS1 signal protects DRS3, DRS4, DRS5.

24.3.2.1. ENLS1 Protection Enable

Use **SOC.DRV1CFG.LSPR1EN** to enable protection signal ENLS1 using PR1 as input.

Use **SOC.DRV1CFG.LSPR2EN** to enable protection signal ENLS1 using PR2 as input.

24.3.2.2. ENHS1 Protection Enable

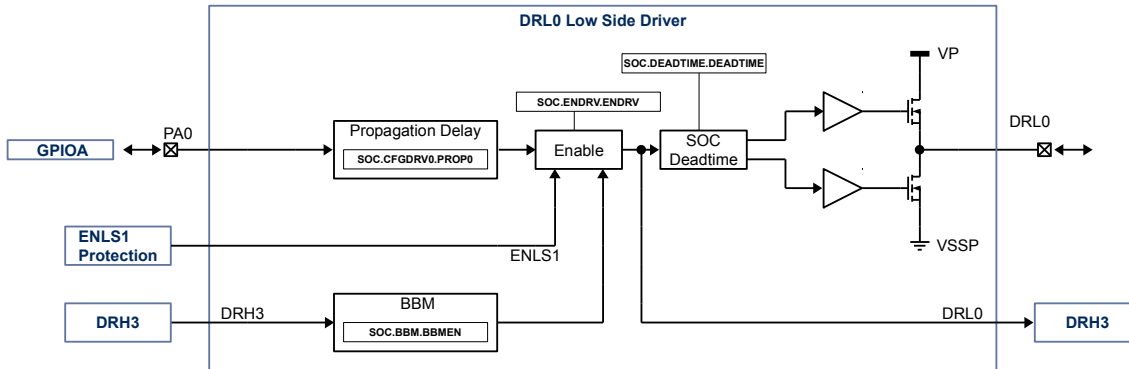

Use **SOC.DRV1CFG.LSPR1EN** to enable protection signal ENHS1 using PR1 as input.

Use **SOC.DRV1CFG.LSPR2EN** to enable protection signal ENHS1 using PR2 as input.

24.4. DRL0 Low Side Driver

24.4.1. Block Diagram

Figure 24-3. DRL0

24.4.2. DRL0

DRL0 is a push-pull low side gate driver, controlled by PA0 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRH3 and configurable protection disable with ENLS1 protection

24.4.2.1. DRL0 Propagation Delay

Use **SOC.CFGDRV0** to set the propagation delay between PA0 input and DRL0 output between 0ns to 200ns.

24.4.2.2. DRL0 Enable

The DRL0 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

24.4.2.3. Break Before Make Control

Use **SOC.ENBBM.BBMEN** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

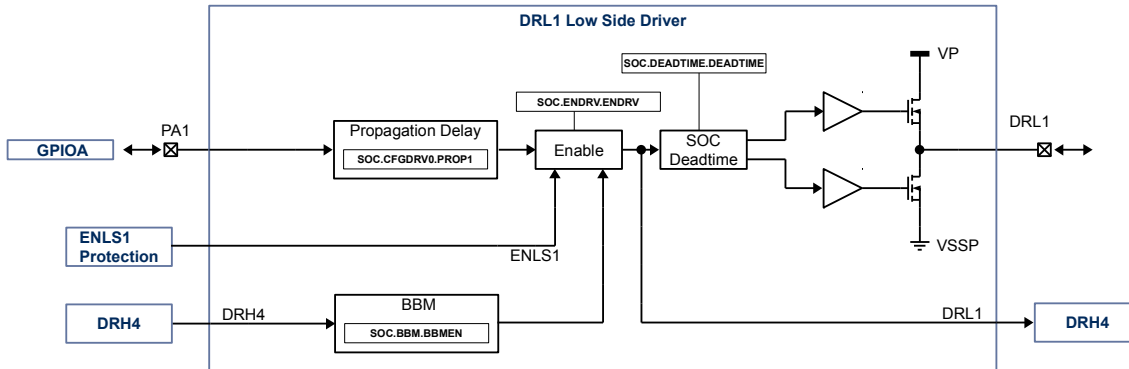

24.4.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

24.5. DRL1 Low Side Driver

24.5.1. Block Diagram

Figure 24-4. DRL1

24.5.2. DRL1

DRL1 is a push-pull low side gate driver, controlled by PA1 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRH4 and configurable protection disable with ENLS1 protection

24.5.2.1. DRL1 Propagation Delay

Use **SOC.CFGDRV0.PROP1** to set the propagation delay between PA1 I/O and DRL1 output between 0ns to 200ns.

24.5.2.2. DRL1 Enable

The DRL1 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

24.5.2.3. Break Before Make Control

Use **SOC.BBMCTL.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

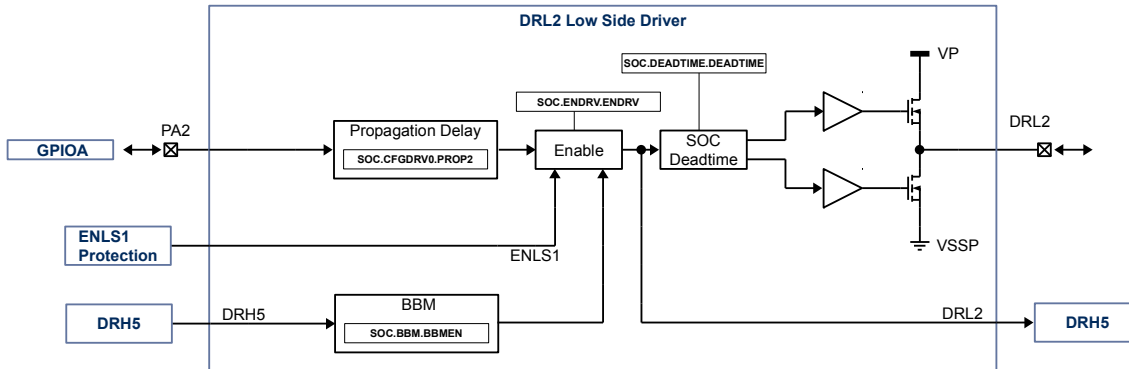

24.5.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

24.6. DRL2 Low Side Driver

24.6.1. Block Diagram

Figure 24-5. DRL2

24.6.2. DRL2

DRL2 is a push-pull low side gate driver, controlled by PA2 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRH5 and configurable protection disable with ENLS1 protection

24.6.2.1. DRL2 Propagation Delay

Use **SOC.CFGDRV0.PROP2** to set the propagation delay between PA2 I/O and DRL2 output between 0ns to 200ns.

24.6.2.2. DRL2 Enable

The DRL2 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENLS1 will disabled the driver if configured.

24.6.2.3. Break Before Make Control

Use **SOC.BBMCTL.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

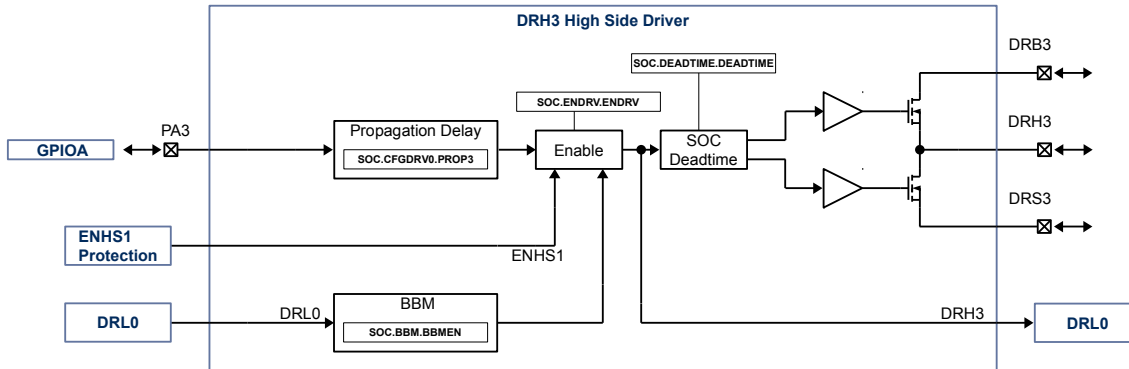

24.6.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

24.7. DRH3 High Side Driver

24.7.1. Block Diagram

Figure 24-6. DRH3

24.7.2. DRH3

DRH3 is a push-pull high side gate driver, controlled by PA3 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRL0 and configurable protection disable with ENHS1 signal from the configurable analog front end.

24.7.2.1. DRH3 Propagation Delay

Use **SOC.CFGDRV0.PROP3** to set the propagation delay between PA3 I/O and DRH3 output between 0ns to 200ns.

24.7.2.2. DRH3 Enable

The DRH3 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured.

24.7.2.3. Break Before Make Control

Use **SOC.ENBBM.BBMEN** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

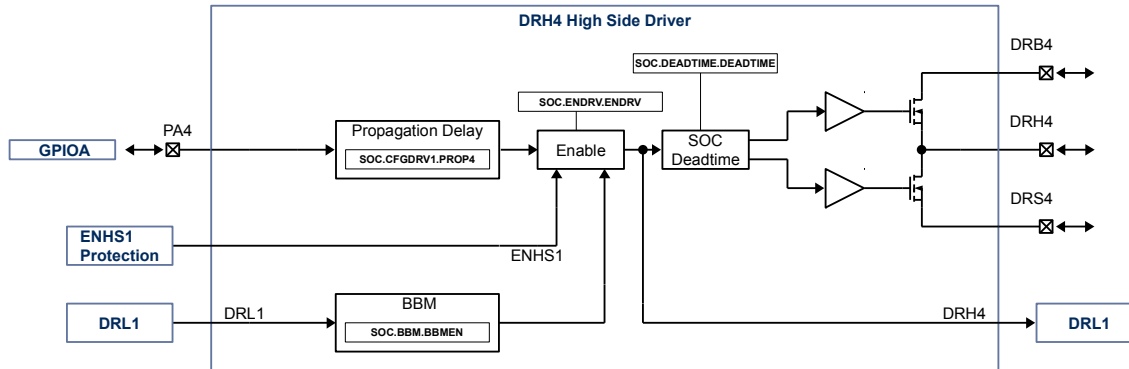

24.7.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

24.8. DRH4 High Side Driver

24.8.1. Block Diagram

Figure 24-7. DRH4

24.8.2. DRH4

DRH4 is a push-pull high side gate driver, controlled by PA4 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRL2 and configurable protection disable with ENHS1 signal from the configurable analog front end.

24.8.2.1. DRH4 Propagation Delay

Use **SOC.CFGDRV1.PROP4** to set the propagation delay between PA4 I/O and DRH4 output between 0ns to 200ns.

24.8.2.2. DRH4 Enable

The DRH4 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured.

24.8.2.3. Break Before Make Control

Use **SOC.BBMCTL.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

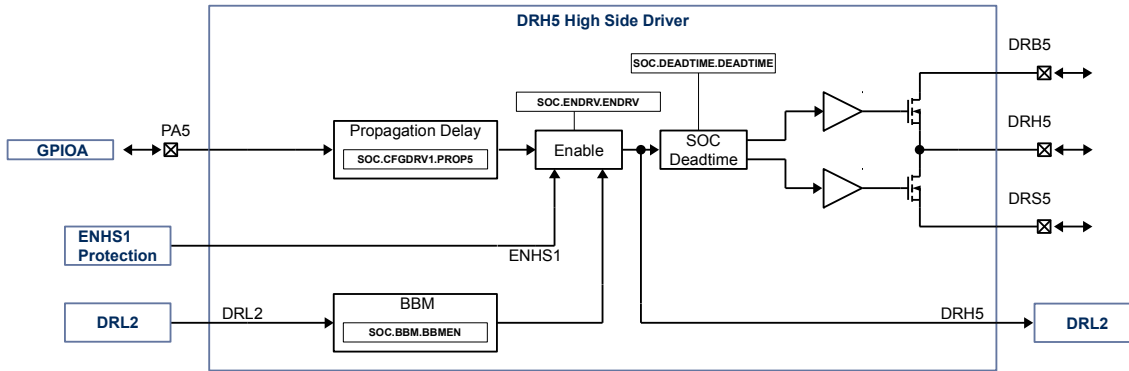

24.8.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

24.9. DRH5 High Side Driver

24.9.1. Block Diagram

Figure 24-8. DRH5

24.9.2. DRH5

DRH5 is a push-pull high side gate driver, controlled by PA5 I/O. The gate driver has configurable propagation delay, hardware dead time, global driver enable, configurable make before break with DRL3 and configurable protection disable with ENHS1 signal from the configurable analog front end.

24.9.2.1. DRH5 Propagation Delay

Use **SOC.CFGDRV1.PROP5** to set the propagation delay between PA5 I/O and DRH5 output between 0ns to 200ns.

24.9.2.2. DRH5 Enable

The DRH5 driver can be enabled with **SOC.ENDRV.ENDRV**. The protection signal ENHS1 will disabled the driver if configured

24.9.2.3. Break Before Make Control

Use **SOC.BBMCTL.ENBBM** to enable the break before make for the high-side low-side pair DRL0-DRH3, DRL1-DRH4, DRL2-DRH5.

24.9.2.4. Hardware Dead Time Control

Use **SOC.HDTCTL.HDTEN** to change the hardware dead time of the push-pull driver for DRLx and DRHx from 50ns to 100ns.

25. ARM CORTEX-M0 REFERENCE

25.1. Introduction

25.1.1. Overview

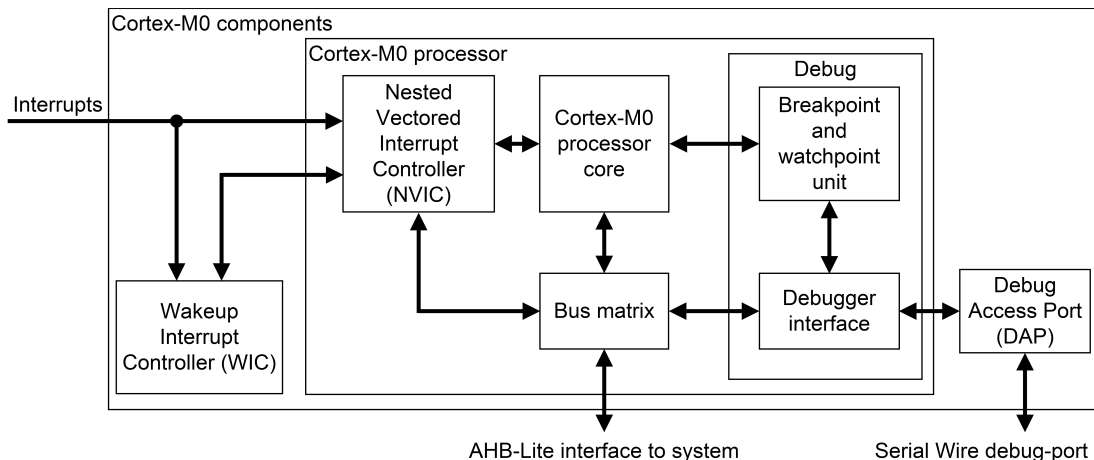

This chapter is taken from the ARM Cortex-M0 User Guide with minimal modifications made to account for the specific Cortex-M0 implementation.

25.1.2. About the Cortex-M0 processor and core peripherals

The Cortex™-M0 processor is an entry-level 32-bit ARM Cortex processor designed for a broad range of embedded applications. It offers significant benefits to developers, including:

- a simple architecture that is easy to learn and program
- ultra-low power, energy efficient operation
- excellent code density
- deterministic, high-performance interrupt handling
- upward compatibility with Cortex-M processor family.

Figure 25-1. Cortex-M0 implementation

The Cortex-M0 processor is built on a highly area and power optimized 32-bit processor core, with a 3-stage pipeline von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier.

The Cortex-M0 processor implements the ARMv6-M architecture, which is based on the 16-bit Thumb® instruction set and includes Thumb-2 technology. This provides the exceptional performance expected of a modern 32-bit architecture, with a higher code density than other 8-bit and 16-bit microcontrollers.

The Cortex-M0 processor closely integrates a configurable Nested Vectored Interrupt Controller (NVIC), to deliver industry-leading interrupt performance. The NVIC:

- includes a non-maskable interrupt (NMI)
- provides zero jitter interrupt option
- provides four interrupt priority levels.

The tight integration of the processor core and NVIC provides fast execution of interrupt service routines (ISRs), dramatically reducing the interrupt latency. This is achieved through the hardware stacking of registers, and the ability to abandon and restart load-multiple and store-multiple operations. Interrupt handlers do not require any assembler wrapper code, removing any code overhead from the ISRs. Tail-chaining optimization also significantly reduces the overhead when switching from one ISR to another.

To optimize low-power designs, the NVIC integrates with the sleep modes, that include a deep sleep function that enables the entire device to be rapidly powered down.

25.1.2.1. System-level interface

The Cortex-M0 processor provides a single system-level interface using AMBA[®] technology to provide high speed, low latency memory accesses.

25.1.2.2. Integrated configurable debug

The Cortex-M0 processor implements a complete hardware debug solution, with extensive hardware breakpoint and watchpoint options. This provides high system visibility of the processor, memory and peripherals through a Serial Wire Debug (SWD) port that is ideal for microcontrollers and other small package devices. The device supports 4 hardware breakpoints.

25.1.2.3. Cortex-M0 processor features summary

- high code density with 32-bit performance
- tools and binary upwards compatible with Cortex-M processor family
- integrated ultra low-power sleep modes
- efficient code execution permits slower processor clock or increases sleep mode time
- single-cycle 32-bit hardware multiplier
- zero jitter interrupt handling
- extensive debug capabilities.

25.1.2.4. Cortex-M0 core peripherals

These are:

25.1.2.4.1. NVIC

The NVIC is an embedded interrupt controller that supports low latency interrupt processing.

25.1.2.4.2. System Control Block

The System Control Block (SCB) is the programmers model interface to the processor. It provides system implementation information and system control, including configuration, control, and reporting of system exceptions.

25.1.2.4.3. System timer

The system timer, SysTick, is a 24-bit count-down timer. Use this as a Real Time Operating System (RTOS) tick timer or as a simple counter.

25.2. The Cortex-M0 Processor

25.2.1. Programmers Model

This section describes the Cortex-M0 programmers model. In addition to the individual core register descriptions, it contains information about the processor modes and stacks.

25.2.1.1. Processor modes

The processor modes are:

Thread mode

Used to execute application software. The processor enters Thread mode when it comes out of reset.

Handler mode

Used to handle exceptions. The processor returns to Thread mode when it has finished all exception processing.

25.2.1.2. Stacks

The processor uses a full descending stack. This means the stack pointer indicates the last stacked item on the stack memory. When the processor pushes a new item onto the stack, it decrements the stack pointer and then writes the item to the new memory location. The processor implements two stacks, the main stack and the process stack, with independent copies of the stack pointer, see Stack Pointer in chapter 25.2.1.3.2 on page 285.

In Thread mode, the CONTROL register controls whether the processor uses the main stack or the process stack, see CONTROL register in chapter 25.2.1.3.12 on page 288. In Handler mode, the processor always uses the main stack. The options for processor operations are:

Table 25-1. Summary of processor mode and stack use options

PROCESSOR MODE	USED TO EXECUTE	STACK USED
Thread	Applications	Main stack or process stack*
Handler	Exception handlers	Main stack

* See CONTROL Register in chapter 25.2.1.3.12 on page 288

25.2.1.3. Core Registers

Figure 25-2. Core Registers

Table 25-2. Core register set summary

NAME	TYPE*	RESET VALUE	DESCRIPTION
R0 – R12	RW	Unknown	General Purpose Register, see chapter 25.2.1.3.1 on page 284
MSP	RW	See description	Stack pointer, see chapter 25.2.1.3.2 on page 285
PSP	RW	Unknown	Stack pointer, see chapter 25.2.1.3.2 on page 285
LR	RW	Unknown	Link Register, see chapter 25.2.1.3.3 on page 285
PC	RW	See description	Program Counter, see chapter 28625.2.1.3.4 on page 285
PSR	RW	Unknown **	Program Status Register, see chapter 25.2.1.3.5 on page 285
APSR	RW	Unknown	Application Program status register, see chapter 25.2.1.3.6 on page 286
IPSR	RW	0x0000 0000	Interrupt Program status register, see chapter 25.2.1.3.7 on page 286
ESPR	RW	Unknown **	Execution Program status register, see chapter 25.2.1.3.8 on page 287
PRIMASK	RW	0x0000 0000	Priority Mask Register, see chapter 25.2.1.3.11 on page 288
CONTROL	RW	0x0000 0000	Control Register, see chapter 25.2.1.3.12 on page 288

*. Describes access type during program execution in thread mode and Handler mode. Debug access can differ.

** . Bit[24] is the T-bit and is loaded from bit[0] of the reset vector.

25.2.1.3.1. General-purpose registers

R0-R12 are 32-bit general-purpose registers for data operations.

25.2.1.3.2. Stack Pointer

The Stack Pointer (SP) is register R13. In Thread mode, bit[1] of the CONTROL register indicates the stack pointer to use:

- 0 = Main Stack Pointer (MSP). This is the reset value.
- 1 = Process Stack Pointer (PSP).

On reset, the processor loads the MSP with the value from address 0x0000 0000

25.2.1.3.3. Link Register

The Link Register (LR) is register R14. It stores the return information for subroutines, function calls, and exceptions. On reset, the LR value is Unknown.

25.2.1.3.4. Program Counter

The Program Counter (PC) is register R15. It contains the current program address. On reset, the processor loads the PC with the value of the reset vector, which is at address 0x0000 0004. Bit[0] of the value is loaded into the EPSR T-bit at reset and must be 1.

25.2.1.3.5. Program Status Register

The Program Status Register (PSR) combines:

- Application Program Status Register (APSR)
- Interrupt Program Status Register (IPSR)
- Execution Program Status Register (EPSR).

These registers are mutually exclusive bitfields in the 32-bit PSR. The PSR bit assignments are:

Figure 25-3. PSR

Access these registers individually or as a combination of any two or all three registers, using the register name as an argument to the `MSR` or `MRS` instructions. For example:

- read all of the registers using PSR with the `MRS` instruction

- write to the APSR using APSR with the MSR instruction.

The PSR combinations and attributes are:

Table 25-3. Core register set summary

REGISTER	TYPE*	COMBINATION
PSR	RW *, **	APSR, EPSR, and IPSR
IEPSR	RO	EPSR and IPSR
IAPSR	RW,*	APSR and IPSR
EAPST	RW,**	APSR and EPSR

* The processor ignores writes to the IPSR bits.

** Reads of the EPSR bits return zero, and the processor ignores writes to the these bits

See the instruction descriptions MRS in chapter 25.3.7.6 on page 337 and MSR in chapter 25.3.7.7 on page 338 for more information about how to access the program status registers.

25.2.1.3.6. Application Program Status Register

The APSR contains the current state of the condition flags, from previous instruction executions. See the register summary in Table 25-2. Core register set summary on page 284 for its attributes. The bit assignments are:

Table 25-4. APSR bit assignments

BIT	NAME	FUNCTION
31	N	Negative Flag
30	Z	Zero Flag
29	C	Carry or Borrow Flag
28	V	Overflow Flag
27:0	Reserved	Reserved

See The condition flags in chapter 25.3.3.6.1 on page 311 for more information about the APSR negative, zero, carry or borrow, and overflow flags.

25.2.1.3.7. Interrupt Program Status Register

The IPSR contains the exception number of the current Interrupt Service Routine (ISR). See the register summary in Table 25-2. Core register set summary on page 284 for its attributes. The bit assignments are:

Table 25-5. IPSR bit assignments

BIT	NAME	FUNCTION
31:6	Reserved	Reserved

BIT	NAME	FUNCTION
5:0	Exception Number	This is the number of the current exception: 63-48: Reserved 47: IRQ31 . . . 16: IRQ0 15: SysTick 14: PendSV 13-12: Reserved 11: SVCALL 10-4: Reserved 3: HardFault 2: NMI 1: Reserved 0: Thread mode see Exception types in chapter 25.2.3.2 on page 295

25.2.1.3.8. Execution Program Status Register

The EPSR contains the Thumb state bit.

See the register summary in Table 25-2. Core register set summary on page 284 for ESPR attributes. The bit assignments are:

Table 25-6. EPSR bit assignments

BIT	NAME	FUNCTION
31:25	Reserved	Reserved
24	T	Thumb state bit
23:0	Reserved	Reserved

Attempts by application software to read the EPSR directly using the `MRS` instruction always return zero. Attempts to write the EPSR using the `MSR` instruction are ignored. Fault handlers can examine the EPSR value in the stacked PSR to determine the cause of the fault. See Exception entry and return in chapter 25.2.3.6 on page 299. The following can clear the T bit to 0:

- instructions `BLX`, `BX` and `POP{PC}`
- restoration from the stacked xPSR value on an exception return
- `bit[0]` of the vector value on an exception entry.

Attempting to execute instructions when the T bit is 0 results in a HardFault or lockup.

See Lockup in chapter 25.2.4.1 on page 301 for more information.

25.2.1.3.9. Interruptible-restartable instructions

The interruptible-restartable instructions are `LDM` and `STM`, and the multiply instruction. When an interrupt occurs during the execution of one of these instructions, the processor abandons execution of the instruction.

After servicing the interrupt, the processor restarts execution of the instruction from the beginning.

25.2.1.3.10. Exception mask register

The exception mask register disables the handling of exceptions by the processor. Disable exceptions where they might impact on timing critical tasks or code sequences requiring atomicity.

To disable or re-enable exceptions, use the `MSR` and `MRS` instructions, or the `CPS` instruction, to change the value of `PRIMASK`. See `MRS` in chapter 25.3.7.6 on page 337, `MSR` in chapter 25.3.7.7 on page 338, and `CPS` in chapter 25.3.7.2 on page 334 for more information.

25.2.1.3.11. Priority Mask Register

The `PRIMASK` register prevents activation of all exceptions with configurable priority.

See the register summary in Table 25-2. Core register set summary on page 284 for its attributes. The bit assignments are:

Figure 25-4. PRIMASK

Table 25-7. PRIMASK register bit assignments

BIT	NAME	FUNCTION
31:1	Reserved	Reserved
0	PRIMASK	1: prevents activation of all exceptions with configurable priority 0: no effect

25.2.1.3.12. Control Register

The `CONTROL` register controls the stack used when the processor is in Thread mode.

See the register summary in Table 25-2. Core register set summary on page 284 for its attributes. The bit assignments are:

Figure 25-5. CONTROL

Table 25-8. CONTROL register bit assignments

BIT	NAME	FUNCTION
31:1	Reserved	Reserved
0	Active Stack Pointer	Defines the current stack: 1: MSP is the current stack pointer 0: PSP is the current stack pointer In Handler mode this bit reads as zero and ignores writes.
0	Reserved	Reserved

Handler mode always uses the MSP, so the processor ignores explicit writes to the active stack pointer bit of the CONTROL register when in Handler mode. The exception entry and return mechanisms update the CONTROL register.

In an OS environment, it is recommended that threads running in Thread mode use the process stack and the kernel and exception handlers use the main stack.

By default, Thread mode uses the MSP. To switch the stack pointer used in Thread mode to the PSP, use the MSR instruction to set the Active stack pointer bit to 1, see MSR in chapter 25.3.7.7 on page 338.

Note

When changing the stack pointer, software must use an ISB instruction immediately after the MSR instruction. This ensures that instructions after the ISB execute using the new stack pointer. See ISB in chapter 25.3.7.5 on page 336.

25.2.1.4. Exceptions and interrupts

The Cortex-M0 processor supports interrupts and system exceptions. The processor and the Nested Vectored Interrupt Controller (NVIC) prioritize and handle all exceptions. An interrupt or exception changes the normal flow of software control. The processor uses handler mode to handle all exceptions except for reset. See Exception entry in chapter 25.2.3.6.5 on page 300 and Exception return in chapter 25.2.3.6.6 on page 300 for more information.

The NVIC registers control interrupt handling. See Nested Vectored Interrupt Controller in chapter 25.4.2 on page 343 for more information.

25.2.1.5. Data Types

The processor:

- supports the following data types:
 - 32-bit words
 - 16-bit halfwords
 - 8-bit bytes
- manages all data memory accesses as little-endian. Instruction memory and Private Peripheral Bus (PPB) accesses are always little-endian. See Memory regions, types and attributes in chapter 25.2.2.1 on page 291 for more information.

25.2.1.6. *The Cortex Microcontroller Software Interface Standard*

ARM provides the Cortex Microcontroller Software Interface Standard (CMSIS) for programming Cortex-M0 microcontrollers. The CMSIS is an integrated part of the device driver library. For a Cortex-M0 microcontroller system, CMSIS defines:

- a common way to:
 - access peripheral registers
 - define exception vectors
- the names of:
 - the registers of the core peripherals
 - the core exception vectors
- a device-independent interface for RTOS kernels.

The CMSIS includes address definitions and data structures for the core peripherals in the Cortex-M0 processor. It also includes optional interfaces for middleware components comprising a TCP/IP stack and a Flash file system.

The CMSIS simplifies software development by enabling the reuse of template code, and the combination of CMSIS-compliant software components from various middleware vendors. Software vendors can expand the CMSIS to include their peripheral definitions and access functions for those peripherals.

This document includes the register names defined by the CMSIS, and gives short descriptions of the CMSIS functions that address the processor core and the core peripherals.

Note

This document uses the register short names defined by the CMSIS. In a few cases these differ from the architectural short names that might be used in other documents.

The following sections give more information about the CMSIS:

- Power management programming hints in chapter 25.2.5.5 on page 304
- Intrinsic functions in chapter 25.3.2 on page 306
- Accessing the Cortex-M0 NVIC registers using CMSIS in chapter 25.4.2.1 on page 344
- NVIC programming hints in chapter 25.4.2.8.1 on page 348

25.2.2. Memory model

This section describes the processor memory map and the behavior of memory accesses. The processor has a fixed memory map that provides up to 4GB of addressable memory. The memory map is:

Figure 25-6. Memory Map

Device	511MB	0xFFFFFFFF
Private peripheral bus	1MB	0xE0100000 0xE00FFFFFF 0xE0000000 0xDFFFFFFF
External device	1.0GB	
External RAM	1.0GB	0xA0000000 0x9FFFFFFF
Peripheral	0.5GB	0x60000000 0x5FFFFFFF
SRAM	0.5GB	0x40000000 0x3FFFFFFF
Code	0.5GB	0x20000000 0x1FFFFFFF
		0x00000000

The processor reserves regions of the Private peripheral bus (PPB) address range for core peripheral registers, see About the Cortex-M0 processor and core peripherals in chapter 25.1.2 on page 281

25.2.2.1. Memory regions, types and attributes

The memory map is split into regions. Each region has a defined memory type, and some regions have additional memory attributes. The memory type and attributes determine the behavior of accesses to the region.

The memory types are:

25.2.2.1.1. Normal

The processor can re-order transactions for efficiency, or perform speculative reads.

25.2.2.1.2. Device

The processor preserves transaction order relative to other transactions to Device or Strongly-ordered memory.

25.2.2.1.3. Strongly-ordered

The processor preserves transaction order relative to all other transactions.

The different ordering requirements for Device and Strongly-ordered memory mean that the memory system can buffer a write to Device memory, but must not buffer a write to Strongly-ordered memory.

The additional memory attributes include.

25.2.2.1.4. Execute Never (XN)

Means the processor prevents instruction accesses. A HardFault exception is generated on executing an instruction fetched from an XN region of memory.

25.2.2.2. Memory system ordering of memory accesses

For most memory accesses caused by explicit memory access instructions, the memory system does not guarantee that the order in which the accesses complete matches the program order of the instructions, providing any re-ordering does not affect the behavior of the instruction sequence. Normally, if correct program execution depends on two memory accesses completing in program order, software must insert a memory barrier instruction between the memory access instructions, see Software ordering of memory accesses in chapter 25.2.2.4 on page 293.

However, the memory system does guarantee some ordering of accesses to Device and Strongly-ordered memory. For two memory access instructions A1 and A2, if A1 occurs before A2 in program order, the ordering of the memory accesses caused by two instructions is:

Figure 25-7. Memory Ordering Restrictions

A1 \ A2	Normal access	Device access		Strongly-ordered access
		Non-shareable	Shareable	
Normal access	-	-	-	-
Device access, non-shareable	-	<	-	<
Device access, shareable	-	-	<	<
Strongly-ordered access	-	<	<	<

Where:

- Means that the memory system does not guarantee the ordering of the accesses.

< Means that accesses are observed in program order, that is, A1 is always observed before A2.

25.2.2.3. Behavior of memory accesses

The behavior of accesses to each region in the memory map is:

Table 25-9. Memory Access Behavior

ADDRESS RANGE	MEMORY REGION	MEMORY TYPE	XN*	DESCRIPTION
0xFFFF FFFF – 0xE010 0000	Device	Device	XN	Reserved
0xE00F FFFF – 0xE000 0000	Private Peripheral Bus	Strongly -ordered	XN	This region includes the NVIC, System timer, and System Control Block. Only word accesses can be used in this region.
0xDFFF FFFF – 0xA000 0000	External Device	Device	XN	External device memory
0x9FFF FFFF – 0x6000 0000	External RAM	Normal	-	Executable region for data
0x5FFF FFFF – 0x4000 0000	Peripheral	Device	XN	External device memory
0x3FFF FFFF – 0x2000 0000	SRAM	Normal	-	Executable region for data. You can also put code here
0x1FFF FFFF - 0x0000 0000	Code	Normal	-	Executable region for program code. You can also put data here

* See Memory regions, types and attributes in chapter 25.2.2.1 on page 291 for more information.

The Code, SRAM, and external RAM regions can hold programs.

25.2.2.4. Software ordering of memory accesses

The order of instructions in the program flow does not always guarantee the order of the corresponding memory transactions. This is because:

- the processor can reorder some memory accesses to improve efficiency, providing this does not affect the behavior of the instruction sequence
- memory or devices in the memory map might have different wait states
- some memory accesses are buffered or speculative.

Memory system ordering of memory accesses in chapter 25.2.2.2 on page 292 describes the cases where the memory system guarantees the order of memory accesses. Otherwise, if the order of memory accesses is critical, software must include memory barrier instructions to force that ordering. The processor provides the following memory barrier instructions:

25.2.2.4.1. DMB

The Data Memory Barrier (DMB) instruction ensures that outstanding memory transactions complete before subsequent memory transactions. See DMB in chapter 25.3.7.3 on page 335.

25.2.2.4.2. DSB

The Data Synchronization Barrier (DSB) instruction ensures that outstanding memory transactions complete

before subsequent instructions execute. See `DSB` in chapter 25.3.7.4 on page 336.

25.2.2.4.3. ISB

The Instruction Synchronization Barrier (`ISB`) ensures that the effect of all completed memory transactions is recognizable by subsequent instructions. See `ISB` in chapter 25.3.7.5 on page 336.

The following are examples of using memory barrier instructions:

25.2.2.4.4. Vector table

If the program changes an entry in the vector table, and then enables the corresponding exception, use a `DMB` instruction between the operations. This ensures that if the exception is taken immediately after being enabled the processor uses the new exception vector.

25.2.2.4.5. Self-modifying code

If a program contains self-modifying code, use an `ISB` instruction immediately after the code modification in the program. This ensures subsequent instruction execution uses the updated program.

25.2.2.4.6. Memory map switching

If the system contains a memory map switching mechanism, use a `DSB` instruction after switching the memory map. This ensures subsequent instruction execution uses the updated memory map.

Memory accesses to Strongly-ordered memory, such as the System Control Block, do not require the use of `DMB` instructions.

25.2.2.5. Memory endianness

The processor views memory as a linear collection of bytes numbered in ascending order from zero. For example, bytes 0-3 hold the first stored word, and bytes 4-7 hold the second stored word. Little-endian format in chapter 25.2.2.5.1 on page 294 describes how words of data are stored in memory.

25.2.2.5.1. Little-endian format

In little-endian format, the processor stores the least significant byte (lsbyte) of a word at the lowest-numbered byte, and the most significant byte (msbyte) at the highest-numbered byte. For example:

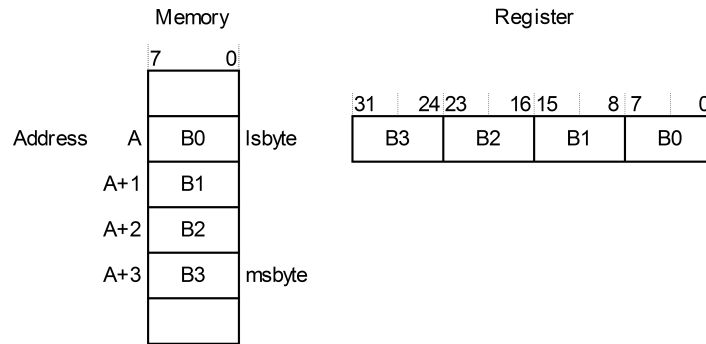

Figure 25-8. Little Endian Format

25.2.3. Exception model

This section describes the exception model.

25.2.3.1. Exception states

Each exception is in one of the following states:

25.2.3.1.1. Inactive

The exception is not active and not pending.

25.2.3.1.2. Pending

The exception is waiting to be serviced by the processor.

An interrupt request from a peripheral or from software can change the state of the corresponding interrupt to pending.

25.2.3.1.3. Active

An exception that is being serviced by the processor but has not completed.

Note

An exception handler can interrupt the execution of another exception handler. In this case both exceptions are in the active state.

25.2.3.1.4. Active and pending

The exception is being serviced by the processor and there is a pending exception from the same source.

25.2.3.2. Exception types

The exception types are:

25.2.3.2.1. Reset

Reset is invoked on power up or a warm reset. The exception model treats reset as a special form of exception. When reset is asserted, the operation of the processor stops, potentially at any point in an instruction. When reset is deasserted, execution restarts from the address provided by the reset entry in the vector table. Execution restarts in Thread mode.

25.2.3.2.2. NMI

A NonMaskable Interrupt (NMI) can be signaled by a peripheral or triggered by software. This is the highest priority exception other than reset. It is permanently enabled and has a fixed priority of -2. NMIs cannot be:

- masked or prevented from activation by any other exception
- preempted by any exception other than Reset.

25.2.3.2.3. HardFault

A HardFault is an exception that occurs because of an error during normal or exception processing. HardFaults have a fixed priority of -1, meaning they have higher priority than any exception with configurable priority.

25.2.3.2.4. SVCcall

A supervisor call (SVC) is an exception that is triggered by the SVC instruction. In an OS environment, applications can use SVC instructions to access OS kernel functions and device drivers.

25.2.3.2.5. PendSV

PendSV is an interrupt-driven request for system-level service. In an OS environment, use PendSV for context switching when no other exception is active.

25.2.3.2.6. SysTick

A SysTick exception is an exception the system timer generates when it reaches zero. Software can also generate a SysTick exception. In an OS environment, the processor can use this exception as system tick.

25.2.3.2.7. Interrupt (IRQ)

An interrupt, or IRQ, is an exception signaled by a peripheral, or generated by a software request. All interrupts are asynchronous to instruction execution. In the system, peripherals use interrupts to communicate with the processor

Table 25-10. Properties of the different exception types

EXCEPTION NUMBER*	IRQ NUMBER*	EXCEPTION TYPE	PRIORITY	VECTOR ADDRESS**	ACTIVATION
1	-	Reset	-3, the highest	0x0000 0004	Asynchronous
2	-14	NMI	-2	0x0000 0008	Asynchronous
3	-13	HardFault	-1	0x0000 000C	Synchronous
4-10	-	Reserved	-	-	-
11	-5	SVCcall	Configurable***	0x0000 002C	Synchronous

EXCEPTION NUMBER*	IRQ NUMBER*	EXCEPTION TYPE	PRIORITY	VECTOR ADDRESS**	ACTIVATION
12-13	-	Reserved	-	-	-
14	-2	PendSV	Configurable***	0x0000 0038	Asynchronous
15	-1	SysTick	Configurable***	0x0000 003C	Asynchronous
16 and above	0 and above	Interrupt (IRQ)	Configurable***	0x0000 0040 and above****	Asynchronous

*To simplify the software layer, the CMSIS only uses IRQ numbers and therefore uses negative values for exceptions other than interrupts. The IPSR returns the Exception number, see Interrupt Program Status Register in chapter 25.2.1.3.5 on page 285.

**See Vector table for more information.

***See Interrupt Priority Registers in chapter 25.4.2.6 on page 346.

****Increasing in steps of 4.

For an asynchronous exception, other than reset, the processor can execute additional instructions between when the exception is triggered and when the processor enters the exception handler.

Privileged software can disable the exceptions that Table 25-10. Properties of the different exception types on page 296 shows as having configurable priority, see Interrupt Clear-enable Register in chapter 25.4.2.3 on page 345.

For more information about HardFaults, see Fault handling in chapter 25.2.4 on page 301.

25.2.3.3. Exception handlers

The processor handles exceptions using:

25.2.3.3.1. Interrupt Service Routines (ISRs)

Interrupts IRQ0 to IRQ31 are the exceptions handled by ISRs.

25.2.3.3.2. Fault handler

HardFault is the only exception handled by the fault handler.

25.2.3.3.3. System handlers

NMI, PendSV, SVC, SysTick, and HardFault are all system exceptions handled by system handlers.

25.2.3.4. Vector table

The vector table contains the reset value of the stack pointer, and the start addresses, also called exception vectors, for all exception handlers. Figure 25-9. Vector Table on page 298 shows the order of the exception vectors in the vector table. The least-significant bit of each vector must be 1, indicating that the exception handler is written in Thumb code.

Figure 25-9. Vector Table

Exception number	IRQ number	Vector	Offset
47	31	IRQ31	0xBC
.		.	.
.		.	.
18	2	IRQ2	0x48
17	1	IRQ1	0x44
16	0	IRQ0	0x40
15	-1	SysTick Reserved	0x3C
14	-2	PendSV	0x38
13		Reserved	
12			
11	-5	SVCall	0x2C
10			
9			
8			
7		Reserved	
6			
5			
4			
3	-13	HardFault	0x10
2	-14	NMI	0x0C
			0x08
1		Reset	0x04
			0x00
		Initial SP value	0x00

The vector table is fixed at address 0x0000 0000.

25.2.3.5. Exception priorities

As Table 25-10. Properties of the different exception types on page 296 shows, all exceptions have an associated priority, with:

- a lower priority value indicating a higher priority
- configurable priorities for all exceptions except Reset, HardFault, and NMI.

If software does not configure any priorities, then all exceptions with a configurable priority have a priority of 0. For information about configuring exception priorities see

- System Handler Priority Registers in chapter 25.4.3.7 on page 354
- Interrupt Priority Registers in chapter 25.4.2.6 on page 346.

Note

Configurable priority values are in the range 0-192, in steps of 64. The Reset, HardFault, and NMI exceptions, with fixed negative priority values, always have higher priority than any other exception.

Assigning a higher priority value to IRQ[0] and a lower priority value to IRQ[1] means that IRQ[1] has higher priority than IRQ[0]. If both IRQ[1] and IRQ[0] are asserted, IRQ[1] is processed before IRQ[0].

If multiple pending exceptions have the same priority, the pending exception with the lowest exception number takes precedence. For example, if both IRQ[0] and IRQ[1] are pending and have the same priority, then IRQ[0] is processed before IRQ[1].

When the processor is executing an exception handler, the exception handler is preempted if a higher priority exception occurs. If an exception occurs with the same priority as the exception being handled, the handler is not preempted, irrespective of the exception number. However, the status of the new interrupt changes to pending.

25.2.3.6. Exception entry and return

Descriptions of exception handling use the following terms:

25.2.3.6.1. Preemption

When the processor is executing an exception handler, an exception can preempt the exception handler if its priority is higher than the priority of the exception being handled.

When one exception preempts another, the exceptions are called nested exceptions. See Exception entry in chapter 25.2.3.6.5 on page 300 for more information.

25.2.3.6.2. Return

This occurs when the exception handler is completed, and:

- there is no pending exception with sufficient priority to be serviced
- the completed exception handler was not handling a late-arriving exception.

The processor pops the stack and restores the processor state to the state it had before the interrupt occurred. See Exception return in chapter 25.2.3.6.6 on page 300 for more information.

25.2.3.6.3. Tail-chaining

This mechanism speeds up exception servicing. On completion of an exception handler, if there is a pending exception that meets the requirements for exception entry, the stack pop is skipped and control transfers to the new exception handler.

25.2.3.6.4. Late-arriving

This mechanism speeds up preemption. If a higher priority exception occurs during state saving for a previous exception, the processor switches to handle the higher priority exception and initiates the vector fetch for that exception. State saving is not affected by late arrival because the state saved would be the same for both exceptions. On return from the exception handler of the late-arriving exception, the normal tail-chaining rules apply.

25.2.3.6.5. Exception entry

Exception entry occurs when there is a pending exception with sufficient priority and either:

- the processor is in Thread mode
- the new exception is of higher priority than the exception being handled, in which case the new exception preempts the exception being handled.

When one exception preempts another, the exceptions are nested.

Sufficient priority means the exception has greater priority than any limit set by the mask register, see Exception mask register in chapter 25.2.1.3.10 on page 288. An exception with less priority than this is pending but is not handled by the processor.

When the processor takes an exception, unless the exception is a tail-chained or a late-arriving exception, the processor pushes information onto the current stack. This operation is referred to as stacking and the structure of eight data words is referred to as a stack frame. The stack frame contains the following information:

Figure 25-10. Exception Entry Stack Contents

Immediately after stacking, the stack pointer indicates the lowest address in the stack frame. The stack frame is aligned to a double-word address.

The stack frame includes the return address. This is the address of the next instruction in the interrupted program. This value is restored to the PC at exception return so that the interrupted program resumes.

The processor performs a vector fetch that reads the exception handler start address from the vector table. When stacking is complete, the processor starts executing the exception handler. At the same time, the processor writes an EXC_RETURN value to the LR. This indicates which stack pointer corresponds to the stack frame and what operation mode the processor was in before the entry occurred.

If no higher priority exception occurs during exception entry, the processor starts executing the exception handler and automatically changes the status of the corresponding pending interrupt to active.

If another higher priority exception occurs during exception entry, the processor starts executing the exception handler for this exception and does not change the pending status of the earlier exception. This is the late arrival case.

25.2.3.6.6. Exception return

Exception return occurs when the processor is in Handler mode and execution of one of the following instructions attempts to set the PC to an EXC_RETURN value:

- a POP instruction that loads the PC
- a BX instruction using any register.

The processor saves an EXC_RETURN value to the LR on exception entry. The exception mechanism relies on this value to detect when the processor has completed an exception handler. Bits[31:4] of an EXC_RETURN value are 0xFFFF FFFF. When the processor loads a value matching this pattern to the PC it detects that the operation is a not a normal branch operation and, instead, that the exception is complete. Therefore, it starts the exception return sequence. Bits[3:0] of the EXC_RETURN value indicate the required return stack and processor mode, as Table 25-11. Execution return behavior on page 301 shows.

Table 25-11. Execution return behavior

EXEC_RETURN	DESCRIPTION
0xFFFF FFF1	Return to Handler mode. Exception return gets state from the main stack. Execution uses MSP after return.
0xFFFF FFF9	Return to Thread mode. Exception return gets state from MSP. Execution uses MSP after return.
0xFFFF FFFD	Return to Thread mode. Exception return gets state from PSP. Execution uses PSP after return.
All other values	Reserved

25.2.4. Fault handling

Faults are a subset of exceptions, see Exception model in chapter 25.2.3 on page 295. All faults result in the HardFault exception being taken or cause lockup if they occur in the NMI or HardFault handler. The faults are:

- execution of an SVC instruction at a priority equal or higher than SVCall
- execution of a BKPT instruction without a debugger attached
- a system-generated bus error on a load or store
- execution of an instruction from an XN memory address
- execution of an instruction from a location for which the system generates a bus fault
- a system-generated bus error on a vector fetch
- execution of an Undefined instruction
- execution of an instruction when not in Thumb-State as a result of the T-bit being previously cleared to 0
- • an attempted load or store to an unaligned address.

Note

Only Reset and NMI can preempt the fixed priority HardFault handler. A HardFault can preempt any exception other than Reset, NMI, or another hard fault.

25.2.4.1. Lockup

The processor enters a lockup state if a fault occurs when executing the NMI or HardFault handlers, or if the system generates a bus error when unstacking the PSR on an exception return using the MSP. When the

processor is in lockup state it does not execute any instructions. The processor remains in lockup state until one of the following occurs:

- it is reset
- a debugger halts it
- an NMI occurs and the current lockup is in the HardFault handler.
-

Note

If lockup state occurs in the NMI handler a subsequent NMI does not cause the processor to leave lockup state.

25.2.5. Power management

The Cortex-M0 processor sleep modes reduce power consumption:

- a sleep mode, that stops the processor clock
- a deep sleep mode, that stops the system clock and switches off the PLL and flash memory.

The SLEEPDEEP bit of the SCR selects which sleep mode is used, see System Control Register in chapter 25.4.3.5 on page 353.

This section describes the mechanisms for entering sleep mode, and the conditions for waking up from sleep mode.

25.2.5.1. Entering sleep mode

This section describes the mechanisms software can use to put the processor into sleep mode.

The system can generate spurious wakeup events, for example a debug operation wakes up the processor. Therefore software must be able to put the processor back into sleep mode after such an event. A program might have an idle loop to put the processor back in to sleep mode.

25.2.5.1.1. Wait for interrupt

The Wait For Interrupt instruction, WFI, causes immediate entry to sleep mode. When the processor executes a WFI instruction it stops executing instructions and enters sleep mode. See WFI in chapter 25.3.7.12 on page 342 for more information.

25.2.5.1.2. Wait for event

The Wait For Event instruction, WFE, causes entry to sleep mode conditional on the value of a one-bit event register. When the processor executes a WFE instruction, it checks the value of the event register:

0: The processor stops executing instructions and enters sleep mode

1: The processor sets the register to zero and continues executing instructions without entering sleep mode.

See WFE in chapter 25.3.7.11 on page 341 for more information.

If the event register is 1b, this indicates that the processor must not enter sleep mode on execution of a `WFE` instruction. Typically, this is because of the assertion of an external event, or because another processor in the system has executed a `SEV` instruction, see `SEV` in chapter 25.3.7.9 on page 339. Software cannot access this register directly.

25.2.5.1.3. Sleep-on-exit

If the `SLEEPONEXIT` bit of the `SCR` is set to 1, when the processor completes the execution of an exception handler and returns to Thread mode it immediately enters sleep mode. Use this mechanism in applications that only require the processor to run when an interrupt occurs.

25.2.5.2. Wakeup from sleep mode

The conditions for the processor to wakeup depend on the mechanism that caused it to enter sleep mode.

25.2.5.2.1. Wakeup from WFI or sleep-on-exit

Normally, the processor wakes up only when it detects an exception with sufficient priority to cause exception entry.

Some embedded systems might have to execute system restore tasks after the processor wakes up, and before it executes an interrupt handler. To achieve this set the `PRIMASK` bit to 1. If an interrupt arrives that is enabled and has a higher priority than current exception priority, the processor wakes up but does not execute the interrupt handler until the processor sets `PRIMASK` to zero. For more information about `PRIMASK`, see Exception mask register in chapter 25.2.1.3.10 on page 288.

25.2.5.2.2. Wakeup from WFE

The processor wakes up if:

- it detects an exception with sufficient priority to cause exception entry.
- it detects an external event signal, see The external event input in chapter 25.2.5.4 on page 304.
- in a multiprocessor system, another processor in the system executes a `SEV` instruction.

In addition, if the `SEVONPEND` bit in the `SCR` is set to 1, any new pending interrupt triggers an event and wakes up the processor, even if the interrupt is disabled or has insufficient priority to cause exception entry. For more information about the `SCR` see System Control Register in chapter 25.4.3.5 on page 353.

25.2.5.3. The Wakeup Interrupt Controller

The Wakeup Interrupt Controller (WIC) is a peripheral that can detect an interrupt and wake the processor from deep sleep mode. The WIC is enabled only when the `DEEPSLEEP` bit in the `SCR` is set to 1b, see System Control Register in chapter 25.4.3.5 on page 353.

The WIC is not programmable, and does not have any registers or user interface. It operates entirely from hardware signals.

When the WIC is enabled and the processor enters deep sleep mode, the power management unit in the system can power down most of the Cortex-M0 processor. This has the side effect of stopping the SysTick timer. When the WIC receives an interrupt, it takes a number of clock cycles to wakeup the processor and restore its state, before it can process the interrupt. This means interrupt latency is increased in deep sleep mode.

25.2.5.4. *The external event input*

The processor provides an external event input signal. This signal is not available on this device.

25.2.5.5. *Power management programming hints*

ISO/IEC C cannot directly generate the WFI, WFE, and SEV instructions. The CMSIS provides the following intrinsic functions for these instructions:

```
void __WFE(void) // Wait for Event
void __WFI(void) // Wait for Interrupt
void __SEV(void) // Send Event
```

25.3. The Cortex-M0 Instruction Set

This chapter is the reference material for the Cortex-M0 instruction set description in a User Guide. The following sections give general information:

- Instruction set summary in chapter 25.3.1 on page 304.
- Intrinsic functions in chapter 25.3.2 on page 306.
- About the instruction descriptions in chapter 25.3.3 on page 307.

Each of the following sections describes a functional group of Cortex-M0 instructions.

Together they describe all the instructions supported by the Cortex-M0 processor:

- Memory access instructions in chapter 25.3.4 on page 312.
- General data processing instructions in chapter 25.3.5 on page 319.
- Branch and control instructions in chapter 25.3.6 on page 331.
- Miscellaneous instructions in chapter 25.3.7 on page 333.

25.3.1. Instruction set summary

The processor implements a version of the Thumb instruction set. Table 25-12. Cortex-M0 instructions lists the supported instructions.

Note

In Table 25-12. Cortex-M0 instructions:

- angle brackets, <>, enclose alternative forms of the operand
- braces, {}, enclose optional operands and mnemonic parts
- the Operands column is not exhaustive.

For more information on the instructions and operands, see the instruction descriptions.

25.3.2. Intrinsic Functions

ISO/IEC C code cannot directly access some Cortex-M0 instructions. This section describes intrinsic functions that can generate these instructions, provided by the CMSIS and that might be provided by a C compiler. If a C compiler does not support an appropriate intrinsic function, you might have to use inline assembler to access the relevant instruction.

The CMSIS provides the following intrinsic functions to generate instructions that ISO/IEC C code cannot directly access:

Table 25-13. CMSIS intrinsic functions to generate some Cortex-M0 instructions

INSTRUCTION	CMSIS INTRINSIC FUNCTION
CPSIE <i>i</i>	<code>void __enable_irq (void)</code>
CPSID <i>i</i>	<code>void __disable_irq (void)</code>
ISB	<code>void __ISB(void)</code>
DSB	<code>void __DSB(void)</code>

INSTRUCTION	CMSIS INTRINSIC FUNCTION
DMB	void __DMB(void)
NOP	void __NOP(void)
REV	uint32_t REV(uint32_t int value)
REV16	uint32_t REV16(uint32_t int value)
REVSH	uint32_t REVSH(uint32_t int value)
SEV	void __SEV(void)
WFE	void __WFE(void)
WFI	void __WFI(void)

The CMSIS also provides a number of functions for accessing the special registers using MRS and MSR instructions:

Table 25-14. CMSIS intrinsic functions to access special registers

SPECIAL REGISTER	ACCESS	CMSIS FUNCTION
PRIMASK	Read	uint32_t __get_PRIMASK (void)
	Write	void __set_PRIMASK (uint32_t value)
CONTROL	Read	uint32_t __get_CONTROL (void)
	Write	void __set_CONTROL (uint32_t value)
MSP	Read	uint32_t __get_MSP (void)
	Write	void __set_MSP (uint32_t TopOfMainStack)
PSP	Read	uint32_t __get_PSP (void)
	Write	void __set_PSP (uint32_t TopOfMainStack)

25.3.3. About the Instruction Descriptions

The following sections give more information about using the instructions:

- Operands in chapter 25.3.3.1 on page 307
- Restrictions when using PC or SP in chapter 25.3.3.2 on page 308
- Shift Operations in chapter 25.3.3.3 on page 308
- Address alignment in chapter 25.3.3.4 on page 310
- PC-relative expressions in chapter 25.3.3.5 on page 310
- Conditional execution in chapter 25.3.3.6 on page 311

25.3.3.1. Operands

An instruction operand can be an ARM register, a constant, or another instruction-specific parameter. Instructions act on the operands and often store the result in a destination register. When there is a destination register in the instruction, it is usually specified before the other operands.

25.3.3.2. Restrictions when using PC or SP

Many instructions are unable to use, or have restrictions on whether you can use, the Program Counter (PC) or Stack Pointer (SP) for the operands or destination register. See instruction descriptions for more information.

Note

When you update the PC with a `BX`, `BLX`, or `POP` instruction, bit[0] of any address must be 1 for correct execution. This is because this bit indicates the destination instruction set, and the Cortex-M0 processor only supports Thumb instructions. When a `BL` or `BLX` instruction writes the value of bit[0] into the LR it is automatically assigned the value 1.

25.3.3.3. Shift Operations

Register shift operations move the bits in a register left or right by a specified number of bits, the shift length. Register shift can be performed directly by the instructions `ASR`, `LSR`, `LSL`, and `ROR` and the result is written to a destination register.

The permitted shift lengths depend on the shift type and the instruction, see the individual instruction description. If the shift length is 0, no shift occurs. Register shift operations update the carry flag except when the specified shift length is 0. The following sub-sections describe the various shift operations and how they affect the carry flag. In these descriptions, *Rm* is the register containing the value to be shifted, and *n* is the shift length.

25.3.3.3.1. ASR

Arithmetic shift right by *n* bits moves the left-hand 32-*n* bits of the register *Rm*, to the right by *n* places, into the right-hand 32-*n* bits of the result, and it copies the original bit[31] of the register into the left-hand *n* bits of the result. See Figure 25-11. `ASR #3` on page 308.

You can use the `ASR` operation to divide the signed value in the register *Rm* by 2^n , with the result being rounded towards negative-infinity.

When the instruction is `ASRS` the carry flag is updated to the last bit shifted out, bit[*n*-1], of the register *Rm*.

Note

- If *n* is 32 or more, then all the bits in the result are set to the value of bit[31] of *Rm*.
- If *n* is 32 or more and the carry flag is updated, it is updated to the value of bit[31] of *Rm*.

Figure 25-11. ASR #3

25.3.3.3.2. LSR

Logical shift right by n bits moves the left-hand $32-n$ bits of the register Rm , to the right by n places, into the right-hand $32-n$ bits of the result, and it sets the left-hand n bits of the result to 0. See Figure 25-12. LSR #3 on page 309.

You can use the LSR operation to divide the value in the register Rm by 2^n , if the value is regarded as an unsigned integer.

When the instruction is LSRs, the carry flag is updated to the last bit shifted out, bit[$n-1$], of the register Rm .

Note

- If n is 32 or more, then all the bits in the result are cleared to 0.
- If n is 33 or more and the carry flag is updated, it is updated to 0.

Figure 25-12. LSR #3

25.3.3.3.3. LSL

Logical shift left by n bits moves the right-hand $32-n$ bits of the register Rm , to the left by n places, into the left-hand $32-n$ bits of the result, and it sets the right-hand n bits of the result to 0. See Figure 25-13. LSL #3 on page 310.

You can use the LSL operation to multiply the value in the register Rm by 2^n , if the value is regarded as an unsigned integer or a two's complement signed integer. Overflow can occur without warning.

When the instruction is LSLs the carry flag is updated to the last bit shifted out, bit[$32-n$], of the register Rm . These instructions do not affect the carry flag when used with LSL #0.

Note

- If n is 32 or more, then all the bits in the result are cleared to 0.
- If n is 33 or more and the carry flag is updated, it is updated to 0.

Figure 25-13. LSL #3

25.3.3.3.4. ROR

Rotate right by n bits moves the left-hand $32-n$ bits of the register Rm , to the right by n places, into the right-hand $32-n$ bits of the result, and it moves the right-hand n bits of the register into the left-hand n bits of the result. See Figure 25-14. ROR #3 on page 310.

When the instruction is `RORS` the carry flag is updated to the last bit rotation, $\text{bit}[n-1]$, of the register Rm .

Note

- If n is 32, then the value of the result is same as the value in Rm , and if the carry flag is updated, it is updated to $\text{bit}[31]$ of Rm .
- ROR with shift length, n , greater than 32 is the same as ROR with shift length $n-32$.

Figure 25-14. ROR #3

25.3.3.4. Address alignment

An aligned access is an operation where a word-aligned address is used for a word, or multiple word access, or where a halfword-aligned address is used for a halfword access. Byte accesses are always aligned.

There is no support for unaligned accesses on the Cortex-M0 processor. Any attempt to perform an unaligned memory access operation results in a HardFault exception.

25.3.3.5. PC-relative expressions

A PC-relative expression or label is a symbol that represents the address of an instruction or literal data. It is represented in the instruction as the PC value plus or minus a numeric offset. The assembler calculates the required offset from the label and the address of the current instruction. If the offset is too big, the assembler produces an error.

Note

- For most instructions, the value of the PC is the address of the current instruction plus 4 bytes.
- Your assembler might permit other syntaxes for PC-relative expressions, such as a label plus or minus a number, or an expression of the form *[PC, #imm]*.

25.3.3.6. Conditional execution

Most data processing instructions update the condition flags in the Application Program Status Register (APSR) according to the result of the operation, see Application Program Status Register in chapter 25.2.1.3.6 on page 286. Some instructions update all flags, and some only update a subset. If a flag is not updated, the original value is preserved. See the instruction descriptions for the flags they affect.

You can execute a conditional branch instruction, based on the condition flags set in another instruction, either:

- immediately after the instruction that updated the flags
- after any number of intervening instructions that have not updated the flags.

On the Cortex-M0 processor, conditional execution is available by using conditional branches.

This section describes:

- The condition flags in chapter 25.3.3.6.1 on page 311
- Condition code suffixes in chapter 25.3.3.6.2 on page 312

25.3.3.6.1. The condition flags

The APSR contains the following condition flags:

- N Set to 1 when the result of the operation was negative, cleared to 0 otherwise.
- Z Set to 1 when the result of the operation was zero, cleared to 0 otherwise.
- C Set to 1 when the operation resulted in a carry, cleared to 0 otherwise.
- V Set to 1 when the operation caused overflow, cleared to 0 otherwise.

For more information about the APSR see Program Status Register in chapter 25.2.1.3.5 on page 285

A carry occurs:

- if the result of an addition is greater than or equal to 2^{32}
- if the result of a subtraction is positive or zero
- as the result of a shift or rotate instruction.

Overflow occurs when the sign of the result, in bit[31], does not match the sign of the result had the operation been performed at infinite precision, for example:

- if adding two negative values results in a positive value
- if adding two positive values results in a negative value
- if subtracting a positive value from a negative value generates a positive value
- if subtracting a negative value from a positive value generates a negative value.

The Compare operations are identical to subtracting, for `CMP`, or adding, for `CMN`, except that the result is discarded. See the instruction descriptions for more information.

25.3.3.6.2. Condition code suffixes

Conditional branch is shown in syntax descriptions as *B{cond}*. A branch instruction with a condition code is only taken if the condition code flags in the APSR meet the specified condition, otherwise the branch instruction is ignored. Table 25-15. Condition code suffixes on page 312 shows the condition codes to use.

Table 25-15. Condition code suffixes on page 312 also shows the relationship between condition code suffixes and the N, Z, C, and V flags.

Table 25-15. Condition code suffixes

SUFFIX	FLAGS	MEANING
EQ	Z = 1	Equal, last flag setting result was zero
NE	Z = 0	Not equal, last flag setting result was non-zero
CS or HS	C = 1	Higher or same, unsigned
CC or LO	C = 0	Lower, unsigned
MI	N = 1	Negative
PL	N = 0	Positive or zero
VS	V = 1	Overflow
VC	V = 0	No overflow
HI	C = 1 and Z = 0	Higher, unsigned
LS	C = 0 or Z = 1	Lower or same, unsigned
GE	N = V	Greater than or equal, signed
LT	N != V	Less than, signed
GT	Z = 0 and N = V	Greater than, signed
LE	Z = 1 and N != V	Less than or equal, signed
AL	Can have any value	Always. This is the default when no suffix is specified

25.3.4. Memory access instructions

Table 25-16. Memory access instructions on page 312 shows the memory access instructions:

Table 25-16. Memory access instructions

MNEMONIC	BRIEF DESCRIPTION	SEE
ADR	Generate PC-Relative Address	ADR in chapter 25.3.4.1 on page 313
LDM	Load Multiple Registers	LDM and STM in chapter 25.3.4.5 on page 317
LDR{type}	Load Register using Immediate Offset	LDR and STR, immediate offset in chapter 25.3.4.2 on page 314
LDR{type}	Load Register Using Register Offset	LDR and STR, register offset in chapter 25.3.4.3 on page 315
LDR	Load Register from PC-Relative Address	LDR, PC-relative in chapter 25.3.4.4 on page 316
POP	Pop Registers From Stack	PUSH and POP in chapter 25.3.4.6 on page 318

MNEMONIC	BRIEF DESCRIPTION	SEE
PUSH	Push Registers To Stack	PUSH and POP in chapter 25.3.4.6 on page 318
STM	Store Multiple Registers	LDM and STM in chapter 25.3.4.5 on page 317
STR{type}	Store Register Using Immediate Offset	LDR and STR in chapter 25.3.4.2 on page 314
STR{type}	Store Register Using Register Offset	LDR and STR in chapter 25.3.4.3 on page 315

25.3.4.1. ADR

Generates a PC-relative address.

25.3.4.1.1. Syntax

ADR *Rd, label*

where:

Rd is the destination register.

Label is a PC-relative expression. See PC-relative expressions in chapter 25.3.3.5 on page 310.

25.3.4.1.2. Operation

ADR generates an address by adding an immediate value to the PC, and writes the result to the destination register.

ADR facilitates the generation of position-independent code, because the address is PC-relative.

If you use ADR to generate a target address for a BX or BLX instruction, you must ensure that bit[0] of the address you generate is set to 1 for correct execution.

25.3.4.1.3. Restrictions

In this instruction *Rd* must specify R0-R7. The data-value addressed must be word aligned and within 1020 bytes of the current PC.

25.3.4.1.4. Condition flags

This instruction does not change the flags.

25.3.4.1.5. Examples

```
ADR R1, TextMessage           ; Write address value of a location labeled as
                               ; TextMessage to R1
```

ADR R3, [PC, #996] ; Set R3 to value of PC + 996.

25.3.4.2. LDR and STR, immediate offset

Load and Store with immediate offset.

25.3.4.2.1. Syntax

LDR *Rt*, [<*Rn* | *SP*> {, #*imm*}]

LDR<B|H> *Rt*, [*Rn* {, #*imm*}]

STR *Rt*, [<*Rn* | *SP*>, {, #*imm*}]

STR<B|H> *Rt*, [*Rn* {, #*imm*}]

where:

Rt is the register to load or store.

Rn is the register on which the memory address is based.

imm is an offset from *Rn*. If *imm* is omitted, it is assumed to be zero.

25.3.4.2.2. Operation

LDR, LDRB and LDRH instructions load the register specified by *Rt* with either a word, byte or halfword data value from memory. Sizes less than word are zero extended to 32-bits before being written to the register specified by *Rt*.

STR, STRB and STRH instructions store the word, least-significant byte or lower halfword contained in the single register specified by *Rt* in to memory. The memory address to load from or store to is the sum of the value in the register specified by either *Rn* or *SP* and the immediate value *imm*.

25.3.4.2.3. Restrictions

In these instructions:

- *Rt* and *Rn* must only specify R0-R7.
- *imm* must be between:
 - 0 and 1020 and an integer multiple of four for LDR and STR using SP as the base register
 - 0 and 124 and an integer multiple of four for LDR and STR using R0-R7 as the base register
 - 0 and 62 and an integer multiple of two for LDRH and STRH
 - 0 and 31 for LDRB and STRB
- The computed address must be divisible by the number of bytes in the transaction, see Address alignment in chapter 25.3.3.4 on page 310.

25.3.4.2.4. Condition flags

These instructions do not change the flags.

25.3.4.2.5. Examples

```
LDR R4, [R7] ; Loads R4 from the address in R7.  
STR R2, [R0,#const-struct] ; const-struct is an expression evaluating  
; to a constant in the range 0-1020.
```

25.3.4.3. LDR and STR, register offset

Load and Store with register offset.

25.3.4.3.1. Syntax

```
LDR Rt, [Rn, Rm]  
LDR<B|H> Rt, [Rn, Rm]  
LDR<SB|SH> Rt, [Rn, Rm]  
STR Rt, [Rn, Rm]  
STR<B|H> Rt, [Rn, Rm]
```

where:

Rt is the register to load or store.
Rn is the register on which the memory address is based.
Rm is a register containing a value to be used as the offset.

25.3.4.3.2. Operation

LDR, LDRB, LDRH, LDRSB and LDRSH load the register specified by *Rt* with either a word, zero extended byte, zero extended halfword, sign extended byte or sign extended halfword value from memory.

STR, STRB and STRH store the word, least-significant byte or lower halfword contained in the single register specified by *Rt* into memory.

The memory address to load from or store to is the sum of the values in the registers specified by *Rn* and *Rm*.

25.3.4.3.3. Restrictions

In these instructions:

- *Rt*, *Rn*, and *Rm* must only specify R0-R7.

- the computed memory address must be divisible by the number of bytes in the load or store, see Address alignment in chapter 25.3.3.4 on page 310.

25.3.4.3.4. Condition flags

These instructions do not change the flags.

25.3.4.3.5. Examples

```
STR R0, [R5, R1]      ; Store value of R0 into an address equal to
                      ; sum of R5 and R1
LDRSH R1, [R2, R3]    ; Load a halfword from the memory address
                      ; specified by (R2 + R3), sign extend to 32-bits
                      ; and write to R1.
```

25.3.4.4. LDR, PC-relative

Load register (literal) from memory.

25.3.4.4.1. Syntax

```
LDR Rt, label
```

where:

Rt is the register to load.

label is a PC-relative expression. See PC-relative expressions in chapter 25.3.3.5 on page 310.

25.3.4.4.2. Operation

Loads the register specified by *Rt* from the word in memory specified by *label*.

25.3.4.4.3. Restrictions

In these instructions, *label* must be within 1020 bytes of the current PC and word aligned.

25.3.4.4.4. Condition flags

These instructions do not change the flags.

25.3.4.4.5. Examples

```
LDR R0, LookUpTable           ; Load R0 with a word of data from an address
                               ; labeled as LookUpTable.
LDR R3, [PC, #100]           ; Load R3 with memory word at (PC + 100).
```

25.3.4.5. LDM and STM

Load and Store Multiple registers.

25.3.4.5.1. Syntax

```
LDM Rn{!}, reglist
STM Rn!, reglist
```

where:

Rn is the register on which the memory addresses are based.

! writeback suffix.

reglist is a list of one or more registers to be loaded or stored, enclosed in braces.

It can contain register ranges. It must be comma separated if it contains more than one register or register range, see Examples in chapter 25.3.4.5.5 on page 318.

LDMIA and LDMFD are synonyms for LDM. LDMIA refers to the base register being Incremented After each access. LDMFD refers to its use for popping data from Full Descending stacks.

STMIA and STMEA are synonyms for STM. STMIA refers to the base register being Incremented After each access. STMEA refers to its use for pushing data onto Empty Ascending stacks.

25.3.4.5.2. Operation

LDM instructions load the registers in *reglist* with word values from memory addresses based on *Rn*.

STM instructions store the word values in the registers in *reglist* to memory addresses based on *Rn*.

The memory addresses used for the accesses are at 4-byte intervals ranging from the value in the register specified by *Rn* to the value in the register specified by $Rn + 4 * (n-1)$, where *n* is the number of registers in *reglist*. The accesses happens in order of increasing register numbers, with the lowest numbered register using the lowest memory address and the highest number register using the highest memory address. If the writeback suffix is specified, the value in the register specified by $Rn + 4 * n$ is written back to the register specified by *Rn*.

25.3.4.5.3. Restrictions

In these instructions:

- *reglist* and *Rn* are limited to R0-R7.
- the writeback suffix must always be used unless the instruction is an `LDM` where *reglist* also contains *Rn*, in which case the writeback suffix must not be used.
- the value in the register specified by *Rn* must be word aligned. See Address alignment in chapter 25.3.3.4 on page 310.
- for `STM`, if *Rn* appears in *reglist*, then it must be the first register in the list.

25.3.4.5.4. Condition flags

These instructions do not change the flags.

25.3.4.5.5. Examples

```
LDM R0, {R0,R3,R4}           ; LDMIA is a synonym for LDM
STMIA R1!, {R2-R4,R6}
```

25.3.4.5.6. Incorrect examples

```
STM R5!, {R4,R5,R6}         ; Value stored for R5 is unpredictable
LDM R2, {}                  ; There must be at least one register in the list
```

25.3.4.6. PUSH and POP

Push registers onto, and pop registers off a full-descending stack.

25.3.4.6.1. Syntax

```
PUSH reglist
```

```
POP reglist
```

where:

reglist is a non-empty list of registers, enclosed in braces. It can contain register ranges. It must be comma separated if it contains more than one register or register range.

25.3.4.6.2. Operation

`PUSH` stores registers on the stack, with the lowest numbered register using the lowest memory address and the

highest numbered register using the highest memory address.

`POP` loads registers from the stack, with the lowest numbered register using the lowest memory address and the highest numbered register using the highest memory address.

`PUSH` uses the value in the `SP` register minus four as the highest memory address, `POP` uses the value in the `SP` register as the lowest memory address, implementing a full-descending stack. On completion, `PUSH` updates the `SP` register to point to the location of the lowest store value, `POP` updates the `SP` register to point to the location above the highest location loaded.

If a `POP` instruction includes `PC` in its *reglist*, a branch to this location is performed when the `POP` instruction has completed. Bit[0] of the value read for the `PC` is used to update the `APSR T-bit`. This bit must be 1 to ensure correct operation.

25.3.4.6.3. Restrictions

In these instructions:

- *reglist* must use only `R0-R7`.
- The exception is `LR` for a `PUSH` and `PC` for a `POP`.

25.3.4.6.4. Condition flags

These instructions do not change the flags.

25.3.4.6.5. Examples

```

PUSH {R0,R4-R7}           ; Push R0,R4,R5,R6,R7 onto the stack
PUSH {R2,LR}              ; Push R2 and the link-register onto the stack
POP {R0,R6,PC}           ; Pop r0,r6 and PC from the stack, then branch to
                        ; the new PC.
  
```

25.3.5. General data processing instructions

Table 25-17. Data processing instructions on page 319 shows the data access instructions:

Table 25-17. Data processing instructions

MNEMONIC	BRIEF DESCRIPTION	SEE

TST	Test	TST in chapter 25.3.5.9 on page 330

25.3.5.1. ADC, ADD, RSB, SBC, and SUB

Add with carry, Add, Reverse Subtract, Subtract with carry, and Subtract.

25.3.5.1.1. Syntax

ADCS {Rd, } Rn, Rm

ADD{S} {*Rd*, } *Rn*, <*Rm*|#*imm*>
RSBS {*Rd*, } *Rn*, *Rm*, #0
SBCS {*Rd*, } *Rn*, *Rm*
SUB{S} {*Rd*, } *Rn*, <*Rm*|#*imm*>

Where:

S causes an ADD or SUB instruction to update flags
Rd specifies the result register
Rn specifies the first source register
Rm specifies the second source register
imm specifies a constant immediate value.

When the optional *Rd* register specifier is omitted, it is assumed to take the same value as *Rn*, for example ADDS *R1*,*R2* is identical to ADDS *R1*,*R1*,*R2*.

25.3.5.1.2. Operation

The ADCS instruction adds the value in *Rn* to the value in *Rm*, adding a further one if the carry flag is set, places the result in the register specified by *Rd* and updates the N, Z, C, and V flags.

The ADD instruction adds the value in *Rn* to the value in *Rm* or an immediate value specified by *imm* and places the result in the register specified by *Rd*.

The ADDS instruction performs the same operation as ADD and also updates the N, Z, C and V flags.

The RSBS instruction subtracts the value in *Rn* from zero, producing the arithmetic negative of the value, and places the result in the register specified by *Rd* and updates the N, Z, C and V flags.

The SBCS instruction subtracts the value of *Rm* from the value in *Rn*, deducts a further one if the carry flag is set. It places the result in the register specified by *Rd* and updates the N, Z, C and V flags.

The SUB instruction subtracts the value in *Rm* or the immediate specified by *imm*. It places the result in the register specified by *Rd*.

The SUBS instruction performs the same operation as SUB and also updates the N, Z, C and V flags.

Use ADC and SBC to synthesize multiword arithmetic, see Examples in chapter 25.3.5.1.4 on page 322.

See also ADR in chapter 25.3.4.1 on page 313.

25.3.5.1.3. Restrictions

Table 25-18. ADC, ADD, RSB, SBC, and SUB operand restrictions on page 321 lists the legal combinations of register specifiers and immediate values that can be used with each instruction.

Table 25-18. ADC, ADD, RSB, SBC, and SUB operand restrictions

INSTRUCTION	RD	Rn	Rm	imm	RESTRICTIONS
ADCS	R0-R7	R0-R7	R0-R7	-	<i>Rd</i> and <i>Rn</i> must specify the same register
ADD	R0-R15	R0-R15	R0-PC	-	<i>Rd</i> and <i>Rn</i> must specify the same register <i>Rn</i> and <i>Rm</i> must not both specify PC
	R0-R7	SP or PC	-	0-1020	Immediate value must be an integer multiple of four
	SP	SP	-	0-508	Immediate value must be an integer multiple of four
ADDS	R0-R7	R0-R7	-	0-7	-
	R0-R7	R0-R7	-	0-255	<i>Rd</i> and <i>Rn</i> must specify the same register
	R0-R7	R0-R7	R0-R7	-	-
RSBS	R0-R7	R0-R7	-	-	-
SBCS	R0-R7	R0-R7	R0-R7	-	<i>Rd</i> and <i>Rn</i> must specify the same register
SUB	SP	SP	-	0-508	Immediate value must be an integer multiple of four
SUBS	R0-R7	R0-R7	-	0-7	-
	R0-R7	R0-R7	-	0-255	<i>Rd</i> and <i>Rn</i> must specify the same register
	R0-R7	R0-R7	R0-R7	-	-

25.3.5.1.4. Examples

Example below shows two instructions that add a 64-bit integer contained in R0 and R1 to another 64-bit integer contained in R2 and R3, and place the result in R0 and R1.

```
ADDS R0, R0, R2      ; add the least significant words
ADCS R1, R1, R3      ; add the most significant words with carry
```

Multiword values do not have to use consecutive registers. Example below shows instructions that subtract a 96-bit integer contained in R1, R2, and R3 from another contained in R4, R5, and R6. The example stores the result in R4, R5, and R6.

```
SUBS R4, R4, R1      ; subtract the least significant words
SBCS R5, R5, R2      ; subtract the middle words with carry
SBCS R6, R6, R3      ; subtract the most significant words with carry
```

Example below the RSBS instruction used to perform a 1's complement of a single register.

```
RSBS R7, R7, #0      ; subtract R7 from zero
```

25.3.5.2. AND, ORR, EOR, and BIC

Logical AND, OR, Exclusive OR, and Bit Clear.

25.3.5.2.1. Syntax

ANDS {*Rd*, } *Rn*, *Rm*

ORRS {*Rd*, } *Rn*, *Rm*

EORS {*Rd*, } *Rn*, *Rm*

BICS {*Rd*, } *Rn*, *Rm*

where:

Rd is the destination register.

Rn is the register holding the first operand and is the same as the destination register.

Rm second register.

25.3.5.2.2. Operation

The AND, EOR, and ORR instructions perform bitwise AND, exclusive OR, and inclusive OR operations on the values in *Rn* and *Rm*.

The BIC instruction performs an AND operation on the bits in *Rn* with the logical negation of the corresponding bits in the value of *Rm*.

The condition code flags are updated on the result of the operation, see Condition flags in chapter 25.3.4.6.4 on page 319.

25.3.5.2.3. Restrictions

In these instructions, *Rd*, *Rn*, and *Rm* must only specify R0-R7.

25.3.5.2.4. Condition flags

These instructions:

- update the N and Z flags according to the result
- do not affect the C or V flag.

25.3.5.2.5. Examples

ANDS R2, R2, R1

ORRS R2, R2, R5

ANDS R5, R5, R8

EORS R7, R7, R6

BICS R0, R0, R1

25.3.5.3. ASR, LSL, LSR, and ROR

Arithmetic Shift Right, Logical Shift Left, Logical Shift Right, and Rotate Right.

25.3.5.3.1. Syntax

ASRS {*Rd*, } *Rm*, *Rs*

ASRS {*Rd*, } *Rm*, #*imm*

LSLS {*Rd*, } *Rm*, *Rs*

LSLS {*Rd*, } *Rm*, #*imm*

LSRS {*Rd*, } *Rm*, *Rs*

LSRS {*Rd*, } *Rm*, #*imm*

RORS {*Rd*, } *Rm*, *Rs*

where:

Rd is the destination register. If *Rd* is omitted, it is assumed to take the same value as *Rm*.

Rm is the register holding the value to be shifted.

Rs is the register holding the shift length to apply to the value in *Rm*.

imm is the shift length. The range of shift length depends on the instruction:

ASR shift length from 1 to 32

LSL shift length from 0 to 31

LSR shift length from 1 to 32.

Note

MOVS *Rd*, *Rm* is a pseudonym for LSLS *Rd*, *Rm*, #0.

25.3.5.3.2. Operation

ASR, LSL, LSR, and ROR perform an arithmetic-shift-left, logical-shift-left, logical-shift-right or a right-rotation of the bits in the register *Rm* by the number of places specified by the immediate *imm* or the value in the least-significant byte of the register specified by *Rs*.

For details on what result is generated by the different instructions, see Shift Operations in chapter 25.3.3.3 on page 308.

25.3.5.3.3. Restrictions

In these instructions, *Rd*, *Rm*, and *Rs* must only specify R0-R7. For non-immediate instructions, *Rd* and *Rm* must specify the same register.

25.3.5.3.4. Condition flags

These instructions update the N and Z flags according to the result.

The C flag is updated to the last bit shifted out, except when the shift length is 0, see Shift Operations in chapter 25.3.3.3 on page 308. The V flag is left unmodified.

25.3.5.3.5. Examples

```
ASRS R7, R5, #9      ; Arithmetic shift right by 9 bits
LSLS R1, R2, #3      ; Logical shift left by 3 bits with flag update
LSRS R4, R5, #6      ; Logical shift right by 6 bits
RORS R4, R4, R6      ; Rotate right by the value in the bottom byte of R6.
```

25.3.5.4. CMP and CMN

Compare and Compare Negative.

25.3.5.4.1. Syntax

CMN *Rn*, *Rm*

CMP *Rn*, #*imm*

CMP *Rn*, *Rm*

where:

Rn is the register holding the first operand.

Rm is the register to compare with.

imm is the immediate value to compare with.

25.3.5.4.2. Operation

These instructions compare the value in a register with either the value in another register or an immediate value. They update the condition flags on the result, but do not write the result to a register.

The CMP instruction subtracts either the value in the register specified by *Rm*, or the immediate *imm* from the value in *Rn* and updates the flags. This is the same as a SUBS instruction, except that the result is discarded.

The CMN instruction adds the value of *Rm* to the value in *Rn* and updates the flags. This is the same as an ADDS

instruction, except that the result is discarded.

25.3.5.4.3. Restrictions

For the:

- CMN instruction *Rn*, and *Rm* must only specify R0-R7.
- CMP instruction:
 - *Rn* and *Rm* can specify R0-R14
 - immediate must be in the range 0-255.

25.3.5.4.4. Condition flags

These instructions update the N, Z, C and V flags according to the result

25.3.5.4.5. Examples

```
CMP R2, R9
```

```
CMN R0, R2
```

25.3.5.5. MOV and MVN

Move and Move NOT.

25.3.5.5.1. Syntax

```
MOV{S} Rd, Rm
```

```
MOVS Rd, #imm
```

```
MVNS Rd, Rm
```

where:

S is an optional suffix. If *S* is specified, the condition code flags are updated on the result of the operation, see Conditional execution in chapter 25.3.3.6 on page 311.

Rd is the destination register.

Rm is a register.

imm is any value in the range 0-255.

25.3.5.5.2. Operation

The `MOV` instruction copies the value of *Rm* into *Rd*.

The `MOVS` instruction performs the same operation as the `MOV` instruction, but also updates the N and Z flags.

The `MVNS` instruction takes the value of *Rm*, performs a bitwise logical negate operation on the value, and places the result into *Rd*.

25.3.5.5.3. Restrictions

In these instructions, *Rd*, and *Rm* must only specify R0-R7.

When *Rd* is the PC in a `MOV` instruction:

- Bit[0] of the result is discarded.
- A branch occurs to the address created by forcing bit[0] of the result to 0. The T-bit remains unmodified.
-

Note

Though it is possible to use `MOV` as a branch instruction, ARM strongly recommends the use of a `BX` or `BLX` instruction to branch for software portability.

25.3.5.5.4. Condition flags

If S is specified, these instructions:

- update the N and Z flags according to the result
- do not affect the C or V flags.

25.3.5.5.5. Example

```
MOVS R0, #0x000B      ; Write value of 0x000B to R0, flags get updated
MOVS R1, #0x0         ; Write value of zero to R1, flags are updated
MOV R10, R12          ; Write value in R12 to R10, flags are not updated
MOVS R3, #23          ; Write value of 23 to R3
MOV R8, SP            ; Write value of stack pointer to R8
MVNS R2, R0           ; Write inverse of R0 to the R2 and update flags
```

25.3.5.6. MULS

Multiply using 32-bit operands, and producing a 32-bit result.

25.3.5.6.1. Syntax

`MULS Rd, Rn, Rm`

where:

Rd is the destination register.

Rn, Rm are registers holding the values to be multiplied.

25.3.5.6.2. Operation

The `MUL` instruction multiplies the values in the registers specified by *Rn* and *Rm*, and places the least significant 32 bits of the result in *Rd*. The condition code flags are updated on the result of the operation, see Conditional execution in chapter 25.3.3.6 on page 311.

The results of this instruction does not depend on whether the operands are signed or unsigned.

25.3.5.6.3. Restrictions

In this instruction:

- *Rd, Rn, and Rm* must only specify R0-R7
- *Rd* must be the same as *Rm*.

25.3.5.6.4. Condition flags

This instruction:

- updates the N and Z flags according to the result
- does not affect the C or V flags.

25.3.5.6.5. Examples

```
MULS R0, R2, R0 ; Multiply with flag update, R0 = R0 x R2
```

25.3.5.7. REV, REV16, and REVSH

Reverse bytes.

25.3.5.7.1. Syntax

`REV Rd, Rn`

`REV16 Rd, Rn`

REVSH *Rd, Rn*

where:

Rd is the destination register.

Rn is the source register.

25.3.5.7.2. Operation

Use these instructions to change endianness of data:

REV converts 32-bit big-endian data into little-endian data or 32-bit little-endian data into big-endian data.

REV16 converts two packed 16-bit big-endian data into little-endian data or two packed 16-bit little-endian data into big-endian data.

REVSH converts 16-bit signed big-endian data into 32-bit signed little-endian data or 16-bit signed little-endian data into 32-bit signed big-endian data.

25.3.5.7.3. Restrictions

In these instructions, *Rd*, and *Rn* must only specify R0-R7.

25.3.5.7.4. Condition flags

These instructions do not change the flags.

25.3.5.7.5. Examples

```
REV R3, R7           ; Reverse byte order of value in R7 and write it to R3
REV16 R0, R0         ; Reverse byte order of each 16-bit halfword in R0
REVSH R0, R5         ; Reverse signed halfword
```

25.3.5.8. SXT and UXT

Sign extend and Zero extend.

25.3.5.8.1. Syntax

SXTB *Rd, Rm*

SXTH *Rd, Rm*

UXTB *Rd, Rm*

UXTH *Rd*, *Rm*

where:

Rd is the destination register.

Rm is the register holding the value to be extended.

25.3.5.8.2. Operation

These instructions extract bits from the resulting value:

- SXTB extracts bits[7:0] and sign extends to 32 bits
- UXTB extracts bits[7:0] and zero extends to 32 bits
- SXTH extracts bits[15:0] and sign extends to 32 bits
- UXTH extracts bits[15:0] and zero extends to 32 bits.

25.3.5.8.3. Restrictions

In these instructions, *Rd* and *Rm* must only specify R0-R7.

25.3.5.8.4. Condition flags

These instructions do not affect the flags.

25.3.5.8.5. Examples

```
SXTH R4, R6           ; Obtain the lower halfword of the
                       ; value in R6 and then sign extend to
                       ; 32 bits and write the result to R4.
UXTB R3, R1           ; Extract lowest byte of the value in R10 and zero
                       ; extend it, and write the result to R3
```

25.3.5.9. TST

Test bits.

25.3.5.9.1. Syntax

TST *Rn*, *Rm*

where:

Rn is the register holding the first operand.

Rm the register to test against.

25.3.5.9.2. Operation

This instruction tests the value in a register against another register. It updates the condition flags based on the result, but does not write the result to a register.

The `TST` instruction performs a bitwise AND operation on the value in *Rn* and the value in *Rm*. This is the same as the `ANDS` instruction, except that it discards the result.

To test whether a bit of *Rn* is 0 or 1, use the `TST` instruction with a register that has that bit set to 1 and all other bits cleared to 0.

25.3.5.9.3. Restrictions

In these instructions, *Rn* and *Rm* must only specify R0-R7.

25.3.5.9.4. Condition flags

This instruction:

- updates the N and Z flags according to the result
- does not affect the C or V flags.

25.3.5.9.5. Examples

```
TST R0, R1           ; Perform bitwise AND of R0 value and R1 value,
                    ; condition code flags are updated but result is discarded
```

25.3.6. Branch and control instructions

Table 25-19. Branch and Control instructions on page 331 shows the branch and control instructions:

Table 25-19. Branch and Control instructions

MNEMONIC	BRIEF DESCRIPTION	SEE
B{CC}	Branch {conditionally}	B, BL, BX, and BLX in chapter 25.3.6.1 on page 332
BL	Branch with Link	B, BL, BX, and BLX in chapter 25.3.6.1 on page 332
BLX	Branch indirect with Link	B, BL, BX, and BLX in chapter 25.3.6.1 on page 332
BX	Branch indirect	B, BL, BX, and BLX in chapter 25.3.6.1 on page 332

25.3.6.1. B, BL, BX, and BLX

Branch instructions.

25.3.6.1.1. Syntax

B{*cond*} *label*

BL *label*

BX *Rm*

BLX *Rm*

where:

cond is an optional condition code, see Conditional execution in chapter 25.3.3.6 on page 311.

label is a PC-relative expression. See PC-relative expressions in chapter 25.3.3.5 on page 310.

Rm is a register providing the address to branch to.

25.3.6.1.2. Operation

All these instructions cause a branch to the address indicated by label or contained in the register specified by *Rm*. In addition:

- The *BL* and *BLX* instructions write the address of the next instruction to LR, the link register R14.
- The *BX* and *BLX* instructions result in a HardFault exception if bit[0] of *Rm* is 0.

BL and *BLX* instructions also set bit[0] of the LR to 1. This ensures that the value is suitable for use by a subsequent POP {PC} or BX instruction to perform a successful return branch.

Table 25-20. Branch ranges on page 332 shows the ranges for the various branch instructions.

Table 25-20. Branch ranges

INSTRUCTION	BRANCH RANGE
B label	-2KB to + 2KB
Bcond label	-256bytes to +254 bytes
BL label	-16MB to +16MB
BX Rm	Any value in register
BLX Rm	Any value in register

25.3.6.1.3. Restrictions

In these instructions:

- Do not use SP or PC in the *BX* or *BLX* instruction.
- For *BX* and *BLX*, bit[0] of *Rm* must be 1 for correct execution. Bit[0] is used to update the EPSR T-bit

and is discarded from the target address.

•

Note

BCOND is the only conditional instruction on the Cortex-M0 processor.

Condition flags

These instructions do not change the flags.

Examples

```

B loopA                ; Branch to loopA
BL func                ; Branch with link (Call) to function func, return address
                       ; stored in LR
BX LR                  ; Return from function call
BLX R0                 ; Branch with link and exchange (Call) to an address stored
                       ; in R0
BEQ labelD             ; Conditionally branch to labelD if last flag setting
                       ; instruction set the Z flag, else do not branch.
  
```

25.3.7. Miscellaneous instructions

Table 25-21. Miscellaneous instructions on page 333 shows the remaining Cortex-M0 instructions:

Table 25-21. Miscellaneous instructions

MNEMONIC	BRIEF DESCRIPTION	SEE
BKPT	Breakpoint	BKPT in chapter 25.3.7.1 on page 334
CPSID	Change Processor State, Diable Interrupts	CPS in chapter 25.3.7.2 on page 334
CPSIE	Change Processor State, Enable Interrupts	CPS in chapter 25.3.7.2 on page 334
DMB	Data Memory Barrier	DMB in chapter 25.3.7.3 on page 335
DSB	Data Synchronization Barrier	DSB in chapter 25.3.7.4 on page 336
ISB	Instruction Synchronization Barrier	ISB in chapter 25.3.7.5 on page 336
MRS	Move from special register to register	MRS in chapter 25.3.7.6 on page 337
MSR	Move form register to special register	MSR in chapter 25.3.7.7 on page 338
NOP	No operation	NOP in chapter 25.3.7.8 on page 339
SEV	Send Event	SEV in chapter 25.3.7.9 on page 339
SVC	Supervisor Call	SVC in chapter 25.3.7.10 on page 340
WFE	Wait for Event	WFE in chapter 25.3.7.11 on page 341
WFI	Wait for interrupt	WFI in chapter 25.3.7.12 on page 342

25.3.7.1. BKPT

Breakpoint.

25.3.7.1.1. Syntax

BKPT #*imm*

where:

imm is an integer in the range 0-255.

25.3.7.1.2. Operation

The BKPT instruction causes the processor to enter Debug state. Debug tools can use this to investigate system state when the instruction at a particular address is reached.

imm is ignored by the processor. If required, a debugger can use it to store additional information about the breakpoint.

The processor might also produce a HardFault or go in to lockup if a debugger is not attached when a BKPT instruction is executed. See Lockup in chapter 25.2.4.1 on page 301 for more information.

25.3.7.1.3. Restrictions

There are no restrictions.

25.3.7.1.4. Condition flags

This instruction does not change the flags.

25.3.7.1.5. Examples

```
BKPT #0 ; Breakpoint with immediate value set to 0x0.
```

25.3.7.2. CPS

Change Processor State.

25.3.7.2.1. Syntax

CPSID *i*

CPSIE *i*

25.3.7.2.2. Operation

CPS changes the PRIMASK special register values. CPSID causes interrupts to be disabled by setting PRIMASK. CPSIE cause interrupts to be enabled by clearing PRIMASK. See Exception mask register in chapter 25.2.1.3.10 on page 288 for more information about these registers.

25.3.7.2.3. Restrictions

There are no restrictions.

25.3.7.2.4. Condition flags

This instruction does not change the condition flags.

25.3.7.2.5. Examples

```
CPSID i           ; Disable all interrupts except NMI (set PRIMASK)
CPSIE i           ; Enable interrupts (clear PRIMASK)
```

25.3.7.3. DMB

Data Memory Barrier.

25.3.7.3.1. Syntax

DMB

25.3.7.3.2. Operation

DMB acts as a data memory barrier. It ensures that all explicit memory accesses that appear in program order before the DMB instruction are observed before any explicit memory accesses that appear in program order after the DMB instruction. DMB does not affect the ordering of instructions that do not access memory.

25.3.7.3.3. Restrictions

There are no restrictions.

25.3.7.3.4. Condition flags

This instruction does not change the flags.

25.3.7.3.5. Examples

DMB ; Data Memory Barrier

25.3.7.4. DSB

Data Synchronization Barrier.

25.3.7.4.1. Syntax

DSB

25.3.7.4.2. Operation

DSB acts as a special data synchronization memory barrier. Instructions that come after the DSB, in program order, do not execute until the DSB instruction completes. The DSB instruction completes when all explicit memory accesses before it complete.

25.3.7.4.3. Restrictions

There are no restrictions.

25.3.7.4.4. Condition flags

This instruction does not change the flags.

25.3.7.4.5. Examples

DSB ; Data Synchronisation Barrier

25.3.7.5. ISB

Instruction Synchronization Barrier.

25.3.7.5.1. Syntax

ISB

25.3.7.5.2. Operation

ISB acts as an instruction synchronization barrier. It flushes the pipeline of the processor, so that all instructions following the ISB are fetched from cache or memory again, after the ISB instruction has been completed.

25.3.7.5.3. Restrictions

There are no restrictions.

25.3.7.5.4. Condition flags

This instruction does not change the flags.

25.3.7.5.5. Examples

```
ISB ; Instruction Synchronisation Barrier
```

25.3.7.6. MRS

Move the contents of a special register to a general-purpose register.

25.3.7.6.1. Syntax

```
MRS Rd, spec_reg
```

where:

Rd is the general-purpose destination register.

spec_reg is one of the special-purpose registers: APSR, IPSR, EPSR, IEPSR, IAPSR, EAPSR, PSR, MSP, PSP, PRIMASK, or CONTROL.

25.3.7.6.2. Operation

MRS stores the contents of a special-purpose register to a general-purpose register. The MRS instruction can be combined with the MSR instruction to produce read-modify-write sequences, which are suitable for modifying a specific flag in the PSR.

See MSR in chapter 25.3.7.7 on page 338.

25.3.7.6.3. Restrictions

In this instruction, *Rd* must not be SP or PC.

25.3.7.6.4. Condition flags

This instruction does not change the flags.

25.3.7.6.5. Examples

```
MRS R0, PRIMASK ; Read PRIMASK value and write it to R0
```

25.3.7.7. MSR

Move the contents of a general-purpose register into the specified special register.

25.3.7.7.1. Syntax

```
MSR spec_reg, Rn
```

where:

Rn is the general-purpose source register.

spec_reg is the special-purpose destination register: APSR, IPSR, EPSR, IEPSR, IAPSR, EAPSR, PSR, MSP, PSP, PRIMASK, or CONTROL.

25.3.7.7.2. Operation

MSR updates one of the special registers with the value from the register specified by *Rn*.

See MRSON 25.3.7.6 on page 337.

25.3.7.7.3. Restrictions

In this instruction, *Rn* must not be SP and must not be PC.

25.3.7.7.4. Condition flags

This instruction updates the flags explicitly based on the value in *Rn*.

25.3.7.7.5. Examples

`MSR CONTROL, R1` ; Read R1 value and write it to the CONTROL register

25.3.7.8. NOP

No Operation.

25.3.7.8.1. Syntax

`NOP`

25.3.7.8.2. Operation

`NOP` performs no operation and is not guaranteed to be time consuming. The processor might remove it from the pipeline before it reaches the execution stage. Use `NOP` for padding, for example to place the subsequent instructions on a 64-bit boundary.

25.3.7.8.3. Restrictions

There are no restrictions.

25.3.7.8.4. Condition flags

This instruction does not change the flags.

25.3.7.8.5. Examples

`NOP` ; No operation

25.3.7.9. SEV

Send Event.

25.3.7.9.1. Syntax

`SEV`

25.3.7.9.2. Operation

`SEV` causes an event to be signaled to all processors within a multiprocessor system. It also sets the local event register, see Power management in chapter 25.2.5 on page 302.

See also `WFE` in in chapter 25.3.7.11 on page 341.

25.3.7.9.3. Restrictions

There are no restrictions.

25.3.7.9.4. Condition flags

This instruction does not change the flags.

25.3.7.9.5. Examples

```
SEV                                ; Send Event
```

25.3.7.10. SVC

Supervisor Call.

25.3.7.10.1. Syntax

```
SVC #imm
```

where:

imm is an integer in the range 0-255.

25.3.7.10.2. Operation

The `svc` instruction causes the SVC exception.

imm is ignored by the processor. If required, it can be retrieved by the exception handler to determine what service is being requested.

25.3.7.10.3. Restrictions

There are no restrictions.

25.3.7.10.4. Condition flags

This instruction does not change the flags.

25.3.7.10.5. Examples

```
SVC #0x32          ; Supervisor Call (SVC handler can extract the immediate value  
                  ; by locating it via the stacked PC)
```

25.3.7.11. WFE

Wait For Event.

25.3.7.11.1. Syntax

```
WFE
```

25.3.7.11.2. Operation

If the event register is 0, `WFE` suspends execution until one of the following events occurs:

- an exception, unless masked by the exception mask registers or the current priority level
- an exception enters the Pending state, if `SEVONPEND` in the System Control Register is set
- a Debug Entry request, if debug is enabled
- an event signaled by a peripheral or another processor in a multiprocessor system using the `SEV` instruction.

If the event register is 1, `WFE` clears it to 0 and completes immediately.

For more information see see Power management in chapter 25.2.5 on page 302.

Note

`WFE` is intended for power saving only. When writing software assume that `WFE` might behave as `NOP`.

25.3.7.11.3. Restrictions

There are no restrictions.

25.3.7.11.4. Condition flags

This instruction does not change the flags.

25.3.7.11.5. Examples

```
WFE                ; Wait for event
```

25.3.7.12. WFI

Wait for Interrupt.

25.3.7.12.1. Syntax

```
WFI
```

25.3.7.12.2. Operation

WFI suspends execution until one of the following events occurs:

- an exception
- an interrupt becomes pending which would preempt if PRIMASK was clear
- a Debug Entry request, regardless of whether debug is enabled.
-

Note

WFI is intended for power saving only. When writing software assume that WFI might behave as a NOP operation.

25.3.7.12.3. Restrictions

There are no restrictions.

25.3.7.12.4. Condition flags

This instruction does not change the flags.

25.3.7.12.5. Examples

```
WFI                ; Wait for interrupt
```

25.4. Cortex-M0 Peripherals

The following sections are the reference material for the ARM Cortex-M0 core peripherals descriptions in a User Guide:

- About the Cortex-M0 peripherals in chapter 25.4.1 on page 343
- Nested Vectored Interrupt Controller in chapter 25.4.2 on page 343
- System Control Block in chapter 25.4.3 on page 349
- System timer, SysTick in chapter 25.4.4 on page 356

25.4.1. About the Cortex-M0 peripherals

The address map of the Private peripheral bus (PPB) is:

Table 25-22. Core peripheral register regions

ADDRESS	CORE PERIPHERAL	DESCRIPTION
0xE000 E008 – 0xE000 E00F	System Control Block	Table 25-31. Summary of the SCB register on page 349
0xE000 E010 – 0xE000 E01F	System Timer	Table 25-40. System timer register summary on page 356
0xE000 E100 – 0xE000 E4EF	Nested Vectored Interrupt Controller	Table 25-23. NVIC register summary on page 343
0xE000 ED00 – 0xE000 ED3F	System Control Block	Table 25-31. Summary of the SCB register on page 349
0xE000 EF00 – 0xE000 EF03	Nested Vectored Interrupt Controller	Table 25-23. NVIC register summary on page 343

In register descriptions, the register type is described as follows:

RW Read and write.

RO Read-only.

WO Write-only.

25.4.2. Nested Vectored Interrupt Controller

This section describes the Nested Vectored Interrupt Controller (NVIC) and the registers it uses. The NVIC supports:

- 1 to 32 interrupts.
- A programmable priority level of 0-192 in steps of 64 for each interrupt. A higher level corresponds to a lower priority, so level 0 is the highest interrupt priority.
- Level and pulse detection of interrupt signals.
- Interrupt tail-chaining.
- An external Non-maskable interrupt (NMI).

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling. The hardware implementation of the NVIC registers is:

Table 25-23. NVIC register summary

ADDRESS	NAME	TYPE	RESET VALUE	DESCRIPTION
0xE000 E100	ISER	RW	0x0000 0000	Interrupt Set-enable Register in chapter 25.4.2.2 on page 344
0xE000 E180	ICER	RW	0x0000 0000	Interrupt Clear-enable Register in chapter 25.4.2.3 on page 345
0xE000 E200	ISPR	RW	0x0000 0000	Interrupt Set-pending Register in chapter 25.4.2.4 on page 345
0xE000 E280	ICPR	RW	0x0000 0000	Interrupt Clear-pending Register in chapter 25.4.2.5 on page 346
0xE000 E400 – 0xE000 E41C	IPR0-7	RW	0x0000 0000	Interrupt Priority Registers in chapter 25.4.2.6 on page 346

25.4.2.1. Accessing the Cortex-M0 NVIC registers using CMSIS

CMSIS functions enable software portability between different Cortex-M profile processors.

To access the NVIC registers when using CMSIS, use the following functions:

Table 25-24. CMSIS access NVIC functions

CMSIS FUNCTION	DESCRIPTION
<code>void NVIC_EnableIRQ(IRQn_Type IRQn) *</code>	Enables an interrupt or exception
<code>void NVIC_DisableIRQ(IRQn_Type IRQn) *</code>	Disables an interrupt or exception
<code>void NVIC_SetPendingIRQ(IRQn_Type IRQn) *</code>	Set the pending status of interrupt or exception to 1
<code>void NVIC_ClearPendingIRQ(IRQn_Type IRQn) *</code>	Clears the pending status of interrupt or exception to 0
<code>uint32_t NVIC_GetPendingIRQ(IRQn_Type IRQn) *</code>	Reads the pending status of interrupt or exception. This function returns non-zero value if the pending status is set to 1.
<code>void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority) *</code>	Sets the priority of an interrupt or exception with configurable priority level to 1
<code>uint32_t NVIC_GetPriority(IRQn_Type IRQn) *</code>	Reads the priority of an interrupt or exception with configurable priority level. This function returns the current priority level

* The input parameter IRQn is the IRQ number see Table 25-10. Properties of the different exception types on page 296 for more information

25.4.2.2. Interrupt Set-enable Register

The ISER enables interrupts, and shows which interrupts are enabled. See the register summary in Table 25-23. NVIC register summary on page 343 for the register attributes.

The bit assignments are:

Figure 25-15. ISER

Table 25-25. ISER bit assignments

BIT	NAME	FUNCTION
31:0	SETENA	Interrupt set-enable bits. Write: 1: enable interrupt 0: no effect Read: 1: interrupt enabled 0: interrupt disabled

If a pending interrupt is enabled, the NVIC activates the interrupt based on its priority.

If an interrupt is not enabled, asserting its interrupt signal changes the interrupt state to pending, but the NVIC never activates the interrupt, regardless of its priority.

25.4.2.3. Interrupt Clear-enable Register

The ICER disables interrupts, and show which interrupts are enabled. See the register summary in Table 25-23. NVIC register summary on page 343 for the register attributes.

The bit assignments are:

Figure 25-16. ICER

Table 25-26. ICER bit assignments

BIT	NAME	FUNCTION
31:0	CLEARENA	Interrupt clear-enable bits. Write: 1: disable interrupt 0: no effect Read: 1: interrupt enabled 0: interrupt disabled

25.4.2.4. Interrupt Set-pending Register

The ISPR forces interrupts into the pending state, and shows which interrupts are pending. See the register summary in Table 25-23. NVIC register summary on page 343 for the register attributes.

The bit assignments are:

Figure 25-17. ISPR

Table 25-27. ISPR bit assignments

BIT	NAME	FUNCTION
31:0	SETPEND	Interrupt set-pending bits. Write: 1: changes interrupt state to pending 0: no effect Read: 1: changes interrupt state to pending 0: interrupt not pending

Note

Writing 1 to the ISPR bit corresponding to:

- an interrupt that is pending has no effect
- a disabled interrupt sets the state of that interrupt to pending.

25.4.2.5. Interrupt Clear-pending Register

The ICPR removes the pending state from interrupts, and shows which interrupts are pending. See the register summary in Table 25-23. NVIC register summary on page 343 for the register attributes.

The bit assignments are:

Figure 25-18. ICPR

Table 25-28. ICPR bit assignments

BIT	NAME	FUNCTION
31:0	CLRPEND	Interrupt clear-pending bits. Write: 1: removes pending state an interrupt 0: no effect Read: 1: interrupt is pending 0: interrupt not pending

Note

Writing 1 to an ICPR bit does not affect the active state of the corresponding interrupt

25.4.2.6. Interrupt Priority Registers

The IPR0-IPR7 registers provide an 8-bit priority field for each interrupt. These registers are only word-accessible. See the register summary in Table 25-23. NVIC register summary on page 343 for their attributes. Each register holds four priority fields as shown:

Figure 25-19. IPR

Table 25-29. IPR bit assignments

BIT	NAME	FUNCTION
31:24	Priority, byte offset 3	Each priority field holds a priority value, 0-192. The lower the value, the greater the priority of the corresponding interrupt. The processor implements only bits[7:6] of each field, bits [5:0] read as zero and ignore writes. This means writing 255 to a priority register saves value 192 to the register
23:16	Priority, byte offset 2	
15:8	Priority, byte offset 1	
7:0	Priority, byte offset 3	

See Accessing the Cortex-M0 NVIC registers using CMSIS in chapter 25.4.2.1 on page 344 for more information about the access to the interrupt priority array, which provides the software view of the interrupt priorities.

Find the IPR number and byte offset for interrupt M as follows:

- the corresponding IPR number, N, is given by $N = M \text{ DIV } 4$
- the byte offset of the required Priority field in this register is $M \text{ MOD } 4$, where:
 - byte offset 0 refers to register bits[7:0]
 - byte offset 1 refers to register bits[15:8]
 - byte offset 2 refers to register bits[23:16]
 - byte offset 3 refers to register bits[31:24]

25.4.2.7. Level-sensitive and pulse interrupts

The processor supports both level-sensitive and pulse interrupts. Pulse interrupts are also described as edge-triggered interrupts.

A level-sensitive interrupt is held asserted until the peripheral deasserts the interrupt signal. Typically this happens because the ISR accesses the peripheral, causing it to clear the interrupt request. A pulse interrupt is an interrupt signal sampled synchronously on the rising edge of the processor clock. To ensure the NVIC detects the interrupt, the peripheral must assert the interrupt signal for at least one clock cycle, during which the NVIC

detects the pulse and latches the interrupt.

When the processor enters the ISR, it automatically removes the pending state from the interrupt, see Hardware and software control of interrupts in chapter 25.4.2.7.1 on page 348. For a level-sensitive interrupt, if the signal is not deasserted before the processor returns from the ISR, the interrupt becomes pending again, and the processor must execute its ISR again. This means that the peripheral can hold the interrupt signal asserted until it no longer needs servicing.

25.4.2.7.1. Hardware and software control of interrupts

The Cortex-M0 latches all interrupts. A peripheral interrupt becomes pending for one of the following reasons:

- the NVIC detects that the interrupt signal is active and the corresponding interrupt is not active
- the NVIC detects a rising edge on the interrupt signal
- software writes to the corresponding interrupt set-pending register bit, see Interrupt Set-pending Register in chapter 25.4.2.4 on page 345

A pending interrupt remains pending until one of the following:

- The processor enters the ISR for the interrupt. This changes the state of the interrupt from pending to active. Then:
 - For a level-sensitive interrupt, when the processor returns from the ISR, the NVIC samples the interrupt signal. If the signal is asserted, the state of the interrupt changes to pending, which might cause the processor to immediately re-enter the ISR. Otherwise, the state of the interrupt changes to inactive.
 - For a pulse interrupt, the NVIC continues to monitor the interrupt signal, and if this is pulsed the state of the interrupt changes to pending and active. In this case, when the processor returns from the ISR the state of the interrupt changes to pending, which might cause the processor to immediately re-enter the ISR. If the interrupt signal is not pulsed while the processor is in the ISR, when the processor returns from the ISR the state of the interrupt changes to inactive.
- Software writes to the corresponding interrupt clear-pending register bit. For a level-sensitive interrupt, if the interrupt signal is still asserted, the state of the interrupt does not change. Otherwise, the state of the interrupt changes to inactive. For a pulse interrupt, state of the interrupt changes to:
 - inactive, if the state was pending
 - active, if the state was active and pending.

25.4.2.8. NVIC usage hints and tips

Ensure software uses correctly aligned register accesses. The processor does not support unaligned accesses to NVIC registers.

An interrupt can enter pending state even if it is disabled. Disabling an interrupt only prevents the processor from taking that interrupt.

25.4.2.8.1. NVIC programming hints

Software uses the CPSIE i and CPSID i instructions to enable and disable interrupts. The CMSIS provides the following intrinsic functions for these instructions:

```
void __disable_irq(void) // Disable Interrupts
void __enable_irq(void) // Enable Interrupts
```

In addition, the CMSIS provides a number of functions for NVIC control, including:

Table 25-30. CMSIS access NVIC functions

CMSIS FUNCTION	DESCRIPTION
void NVIC_EnableIRQ(IRQn_Type IRQn)	Enable IRQn
void NVIC_DisableIRQ(IRQn_Type IRQn)	Disable IRQn
uint32_t NVIC_GetPendingIRQ(IRQn_Type IRQn)	Return true (1) if IRQn is pending
void NVIC_SetPendingIRQ(IRQn_Type IRQn)	Set IRQn pending
void NVIC_ClearPendingIRQ(IRQn_Type IRQn)	Clear IRQn pending state
void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority)	Set priority for IRQn
uint32_t NVIC_GetPriority(IRQn_Type IRQn)	Read priority of IRQn
void NVIC_SystemReset (void)	Reset the system

The input parameter IRQn is the IRQ number, see Table 25-10. Properties of the different exception types on page 296 more information. For more information about these functions, see the CMSIS documentation.

25.4.3. System Control Block

The System Control Block (SCB) provides system implementation information, and system control. This includes configuration, control, and reporting of the system exceptions. The SCB registers are:

Table 25-31. Summary of the SCB register

ADDRESS	NAME	TYPE	RESET VALUE	DESCRIPTION
0xE000 ED00	CPUID	RO	0x410C C200	CPUID Register in chapter 25.4.3.2 on page 350
0xE000 ED04	ICSR	RW*	0x0000 0000	Interrupt Control and State Register in chapter 25.4.3.3 on page 350
0xE00 ED0C	AIRCR	RW*	0xFA05 0000	Application Interrupt and Reset Control Register in chapter 25.4.3.4 on page 352
0xE000 ED10	SCR	RW	0x0000 0000	System Control Register in chapter 25.4.3.5 on page 353
0xE000 ED14	CCR	RW	0x0000 0204	Configuration and Control register in chapter 25.4.3.6 on page 354
0xE000 ED1C	SHPR2	RW	0x0000 0000	System Handler Priority register in chapter 25.4.3.7 on page 354
0xE000 ED20	SHPR3	RW	0x0000 0000	System Handler Priority register in chapter 25.4.3.7 on page 354

* See the register description for more information

25.4.3.1. The CMSIS mapping of the Cortex-M0 SCB registers

To improve software efficiency, the CMSIS simplifies the SCB register presentation. In the CMSIS, the array SHP[1] corresponds to the registers SHPR2-SHPR3

25.4.3.2. CPUID Register

The CPUID register contains the processor part number, version, and implementation information. See the register summary in Table 25-32. CPUID register bit assignments on page 350 for its attributes. The bit assignments are:

Figure 25-20. CPUID

Table 25-32. CPUID register bit assignments

BIT	NAME	FUNCTION
31:24	Implementer	Implementer code: 0x41 = ARM
23:20	Variant	Variant number, the r value in the rnpn product revision identifier: 0x0 = Revision 0
19:16	Constant	Constant that defines the architecture of the processor:, reads as 0xC = ARMv6-M architecture
15:4	Partno	Part number of the processor: 0xC20 = Cortex-M0
3:0	Revision	Revision number, the p value in the rnpn product revision identifier: 0x0 = Patch 0

25.4.3.3. Interrupt Control and State Register

The ICSR:

- provides:
 - a set-pending bit for the Non-Maskable Interrupt (NMI) exception
 - set-pending and clear-pending bits for the PendSV and SysTick exceptions
- indicates:
 - the exception number of the exception being processed
 - whether there are preempted active exceptions
 - the exception number of the highest priority pending exception
 - whether any interrupts are pending.

See the register summary in Table 25-33. ICSR register bit assignments on page 351 for the ICSR attributes. The bit assignments are:

Figure 25-21. ICSR

Table 25-33. ICSR register bit assignments

BIT	NAME	TYPE	FUNCTION
31	NMIPENDSET	RW	NMI set-pending bit Write: 1: changes NMI exception state to pending 0: no effect Read: 1: NMI exception is pending 0: NMI exception is not pending Because NMI is the highest-priority exception, normally the processor enters the NMI exception handler as soon as it detects a write of 1 to this bit. Entering the handler then clears this bit to 0. This means a read of this bit by the NMI exception handler returns 1 only if the NMI signal is reasserted while the processor is executing that handler.
30:29	Reserved	RW	Reserved
28	PENDSVSET	RW	PendSV set-pending bit Write: 1: changes PendSV exception state to pending 0: no effect Read: 1: PendSV exception is pending 0: PendSV exception is not pending Writing 1 to this bit is the only way to set the PendSV state to pending
27	PENDSVCLR	WO	PendSV clear-pending bit Write: 1: removes the pending state from the PendSV exception 0: no effect
26	PENDSTSET	RW	SysTick exception set-pending bit. Write: 1: changes SysTick exception state to pending 0: no effect Read: 1: SysTick exception is pending 0: SysTick exception is not pending
25	PENDSTCLR	WO	SysTick exception clear-pending bit. Write: 1: removes the pending state from the SysTick exception This bit is WO. On a register read it's value is unknown
24:23	Reserved	RW	Reserved
22	ISRPENDING	RO	Interrupt pending flag, excluding NMI and Faults: 1: Interrupt pending 0: Interrupt not pending

BIT	NAME	TYPE	FUNCTION
21:18	Reserved	RW	Reserved
17:12	VECTPENDING	RO	Indicates the exception number of the highest priority pending enabled exception: Nonzero: the exception number of the highest priority pending enabled exception 0: no pending exceptions
11:6	Reserved	RW	Reserved
5:0	VECTACTIVE*	RO	Contains the active exception number: Nonzero: The exception number* of the currently active exception 0: Thread mode Note: Subtract 16 from this value to obtain the CMSIS IRQ number that identifies the corresponding bit in the Interrupt Clear-Enable, Set-Enable, Clear-Pending, Set-pending, and Priority Register, see Table 25-5. IPSR bit assignments on page 286

* This is the same value as IPSR bits[5:0], see Table 25-5. IPSR bit assignments on page 286

When you write to the ICSR, the effect is Unpredictable if you:

- write 1 to the PENDSVSET bit and write 1 to the PENDSVCLR bit
- write 1 to the PENDSTSET bit and write 1 to the PENDSTCLR bit.

25.4.3.4. Application Interrupt and Reset Control Register

The AIRCR provides endian status for data accesses and reset control of the system. See the register summary in Table 25-31. Summary of the SCB register on page 349 and Table 25-34. AIRCR register bit assignments on page 352 for its attributes.

To write to this register, you must write 0x05FA to the VECTKEY field, otherwise the processor ignores the write.

The bit assignments are:

Figure 25-22. AIRCR

Table 25-34. AIRCR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:16	VECTKEY	RW	Register key Read: unknown Write: write 0x05FA to VECTKEY, otherwise the write is ignored
15	ENDIANESS	RO	Data endianess implemented 0x0: Little Endian

BIT	NAME	TYPE	FUNCTION
14:3	Reserved	RW	Reserved
2	SYSRESETREQ	WO	System reset request: Read: This bit reads as 0. Write: 1: requests a system level reset. 0: no effect
1	VECTCLRACTIVE	WO	Reserved for debug use. This bit reads as 0. When writing to the register you must write 0 to this bit, otherwise behavior is Unpredictable.
0	Reserved	RW	Reserved

25.4.3.5. System Control Register

The SCR controls features of entry to and exit from low power state. See the register summary in Table 25-35. SCR register bit assignments on page 353 for its attributes. The bit assignments are:

Figure 25-23. SCR

Table 25-35. SCR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:5	Reserved	R	Reserved
4	SEVONPEND	RW	Send Event on Pending bit: 1: enabled events and all interrupts, including disabled interrupts, can wakeup the processor 0: only enabled interrupts or events can wakeup the processor ,disabled interrupts are excluded When an event or interrupt enters pending state, the event signal wakes up the processor from WFE. If the processor is not waiting for an event ,the event is registered and affects the next WFE. The processor also wakes up on execution of an SEV instruction or external event
3	Reserved	R	Reserved
2	SLEEPDEEP	RW	Controls whether the processor uses sleep or deep sleep as its low power mode: 1: deep sleep 0: sleep

BIT	NAME	TYPE	FUNCTION
1	SLEEPONEXIT	RW	Indicates sleep-on-exit when returning from Handler mode to Thread mode: 1: enter sleep, or deep sleep, on return from an ISR to Thread mode. 0: do not sleep when returning to Thread mode. Setting this bit to 1 enables an interrupt driven application to avoid returning to an empty main application
0	Reserved	R	Reserved

25.4.3.6. Configuration and Control Register

The CCR is a read-only register and indicates some aspects of the behavior of the Cortex-M0 processor. See the register summary in Table 25-36. CCR register bit assignments in page 354 for the CCR attributes. The bit assignments are:

Figure 25-24. CCR

Table 25-36. CCR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:10	Reserved	R	Reserved
9	STKALIGN	RW	Always reads as one, indicates 8-byte stack alignment on exception entry. On exception entry, the processor uses bit[9] of the stacked PSR to indicate the stack alignment. On return from the exception it uses this stacked bit to restore the correct stack alignment.
8:4	Reserved	R	Reserved
3	UNALIGN_TRP	RW	Always reads as one, indicates that all unaligned accesses generate a HardFault.
0	Reserved	R	Reserved

25.4.3.7. System Handler Priority Registers

The SHPR2-SHPR3 registers set the priority level, 0 to 192, of the exception handlers that have configurable priority.

SHPR2-SHPR3 are word accessible. See the register summary in Table 25-31. Summary of the SCB register on page 349 for their attributes.

To access to the system exception priority level using CMSIS, use the following CMSIS functions:

- `uint32_t NVIC_GetPriority(IRQn_Type IRQn)`
- `void NVIC_SetPriority(IRQn_Type IRQn, uint32_t priority)`

The input parameter IRQn is the IRQ number, see Table 25-10. Properties of the different exception types on

page 296 for more information.

The system fault handlers, and the priority field and register for each handler are:

Table 25-37. System fault handler priority fields

HANDLER	FIELD	REGISTER DESCRIPTION
SVCall	PRI_11	System handler Priority Register 2 on page
PendSV	PRI_14	System Handler Priority register 3 on page
SysTick	PRI_15	System Handler Priority register 3 on page

Each PRI_N field is 8 bits wide, but the processor implements only bits[7:6] of each field, and bits[5:0] read as zero and ignore writes.

25.4.3.7.1. System Handler Priority Register 2

The bit assignments are:

Figure 25-25. SHPR2

Table 25-38. SHPR2 register bit assignments

BIT	NAME	TYPE	FUNCTION
31:24	PRI_11	RW	Priority of system Handler 11, SVCall
23:0	Reserved	R	Reserved

25.4.3.7.2. System Handler Priority Register 3

The bit assignments are:

Figure 25-26. SHPR3

Table 25-39. SHPR3 register bit assignments

BIT	NAME	TYPE	FUNCTION
31:24	PRI_15	RW	Priority of system Handler 15, SysTick exception

BIT	NAME	TYPE	FUNCTION
23:16	PRI_14	RW	Priority of system Handler 14, PendSV
15:0	Reserved	R	Reserved

25.4.3.8. SCB usage hints and tips

Ensure software uses aligned 32-bit word size transactions to access all the SCB registers.

25.4.4. System timer, SysTick

When enabled, the timer counts down from the reload value to zero, reloads (wraps to) the value in the SYST_RVR on the next clock cycle, then decrements on subsequent clock cycles. Writing a value of zero to the SYST_RVR disables the counter on the next wrap. When the counter transitions to zero, the COUNTFLAG status bit is set to 1. Reading SYST_CSR clears the COUNTFLAG bit to 0.

Writing to the SYST_CVR clears the register and the COUNTFLAG status bit to 0. The write does not trigger the SysTick exception logic. Reading the register returns its value at the time it is accessed.

Note

When the processor is halted for debugging the counter does not decrement. The system timer registers are:

Table 25-40. System timer register summary

ADDRESS	NAME	TYPE	RESET VALUE	DESCRIPTION
0xE000 E010	SYST_CSR	RW	0x0000 0000	Systick Control and Status Register in chapter 25.4.4.1 on page 356
0xE000 E014	SYST_RVR	RW	Unknown	Systick Reload Value Register in chapter 25.4.4.2 on page 357
0xE000 E018	SYST_CVR	RW	Unknown	Systick Current Register in chapter 25.4.4.3 on page 358
0xE000 E01C	SYST_CALIB	RO	0x0000 0000	Systick Calibration value Register in chapter 25.4.4.4 on page 358

25.4.4.1. SysTick Control and Status Register

The SYST_CSR enables the SysTick features. See the register summary in Table 25-41. SYST_CSR register bit assignments on page 357 for its attributes. The bit assignments are:

Figure 25-27. SYST_CSR

Table 25-41. SYST_CSR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:17	Reserved	R	Reserved
16	COUNTFLAG	RW	Returns 1 if timer counted to 0 since the last read of this register
15:3	Reserved	R	Reserved
2	CLKSOURCE	RW	Selects the SysTick timer clock source 1: HCLK 0: FCLK / 3
1	TICKINT	RW	Enables SysTick exception request 1: counting down to zero to assert the SysTick exception request 0: counting down to zero does not assert the SysTick exception request
0	ENABLE	RW	Enables the counter 1: counter enabled 0: counter disabled

25.4.4.2. SysTick Reload Value Register

The SYST_RVR specifies the start value to load into the SYST_CVR. See the register summary in Table 25-42. SYST_RVR register bit assignments on page 357 for its attributes. The bit assignments are:

Figure 25-28. SYST_RVR

Table 25-42. SYST_RVR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:24	Reserved	R	Reserved
23:0	RELOAD	RW	Value to load into the SYST_CVR when the counter is enabled and when it reaches 0, see Calculating the RELOAD value.

25.4.4.2.1. Calculating the RELOAD value

The RELOAD value can be any value in the range 0x000 00001 – 0x00FF FFFF. You can program a value of 0,

but this has no effect because the SysTick exception request and COUNTFLAG are activated when counting from 1 to 0.

To generate a multi-shot timer with a period of N processor clock cycles, use a RELOAD value of N-1. For example, if the SysTick interrupt is required every 100 clock pulses, set RELOAD to 99.

25.4.4.3. SysTick Current Value Register

The SYST_CVR contains the current value of the SysTick counter. See the register summary in Table 25-43. SYST_CVR register bit assignments on page 358 for its attributes. The bit assignments are:

Figure 25-29. SYST_CVR

Table 25-43. SYST_CVR register bit assignments

BIT	NAME	TYPE	FUNCTION
31:24	Reserved	R	Reserved
23:0	CURRENT	RW	Reads return the current value of the SysTick counter. A write of any value clears the field to 0, and also clears the SYST_CSR.COUNTFLAG bit to 0.

25.4.4.4. SysTick Calibration Value Register

The SYST_CALIB register indicates the SysTick calibration properties. See the register summary in Table 25-44. SYST_CALIB register bit assignments on page 358 for its attributes. The bit assignments are:

Figure 25-30. SYST_CALIB

Table 25-44. SYST_CALIB register bit assignments

BIT	NAME	TYPE	FUNCTION
31	NOREF	R	Reads as one. Indicates no separate reference clock is provided
30	SKEW	R	Reads as one. Calibration value for the 10ms inexact timing is not known because TENMS is not known. This can affect the suitability of SysTick as a software real time clock.

BIT	NAME	TYPE	FUNCTION
29:24	Reserved	R	Reserved
23:0	TENMS	RW	Reads as zero. Indicates calibration value is not known

If calibration information is not known, calculate the calibration value required from the frequency of the processor clock or external clock.

25.4.4.5. *SysTick usage hints and tips*

The interrupt controller clock updates the SysTick counter.

Ensure software uses word accesses to access the SysTick registers.

If the SysTick counter reload and current value are undefined at reset, the correct initialization sequence for the SysTick counter is:

1. Program reload value.
2. Clear current value.
3. Program Control and Status register.
